

## Matteo Monelli

**Title:** The star formation history of nearby galaxies

**Abstract:** *In this talk I will summarize the final results of the LCID project, focusing on the star formation history of isolated galaxies in the Local Group. The early evolution of six isolated dwarfs will be compared to that of the Milky Way and M31 satellites. Finally, I will discuss the impact of the E-ELT in the derivation of the star formation history of more distant galaxies, based on their resolved stellar populations.*
