WASP-6b	Trans	Flat+Ray	Jordan+2013
WASP-12b	Trans	Flat+Ray	Copperwheat+2013, Sing+2013
WASP-17b	Trans	Flat+noRay	Mandell+2013, Wood+2011
WASP-19b	Trans	H2O+clouds?	Huitson+2013
WASP-43b	Trans	Flat+noRay	Chen+2014
XO1-b	Trans	Flat	Deming+2013

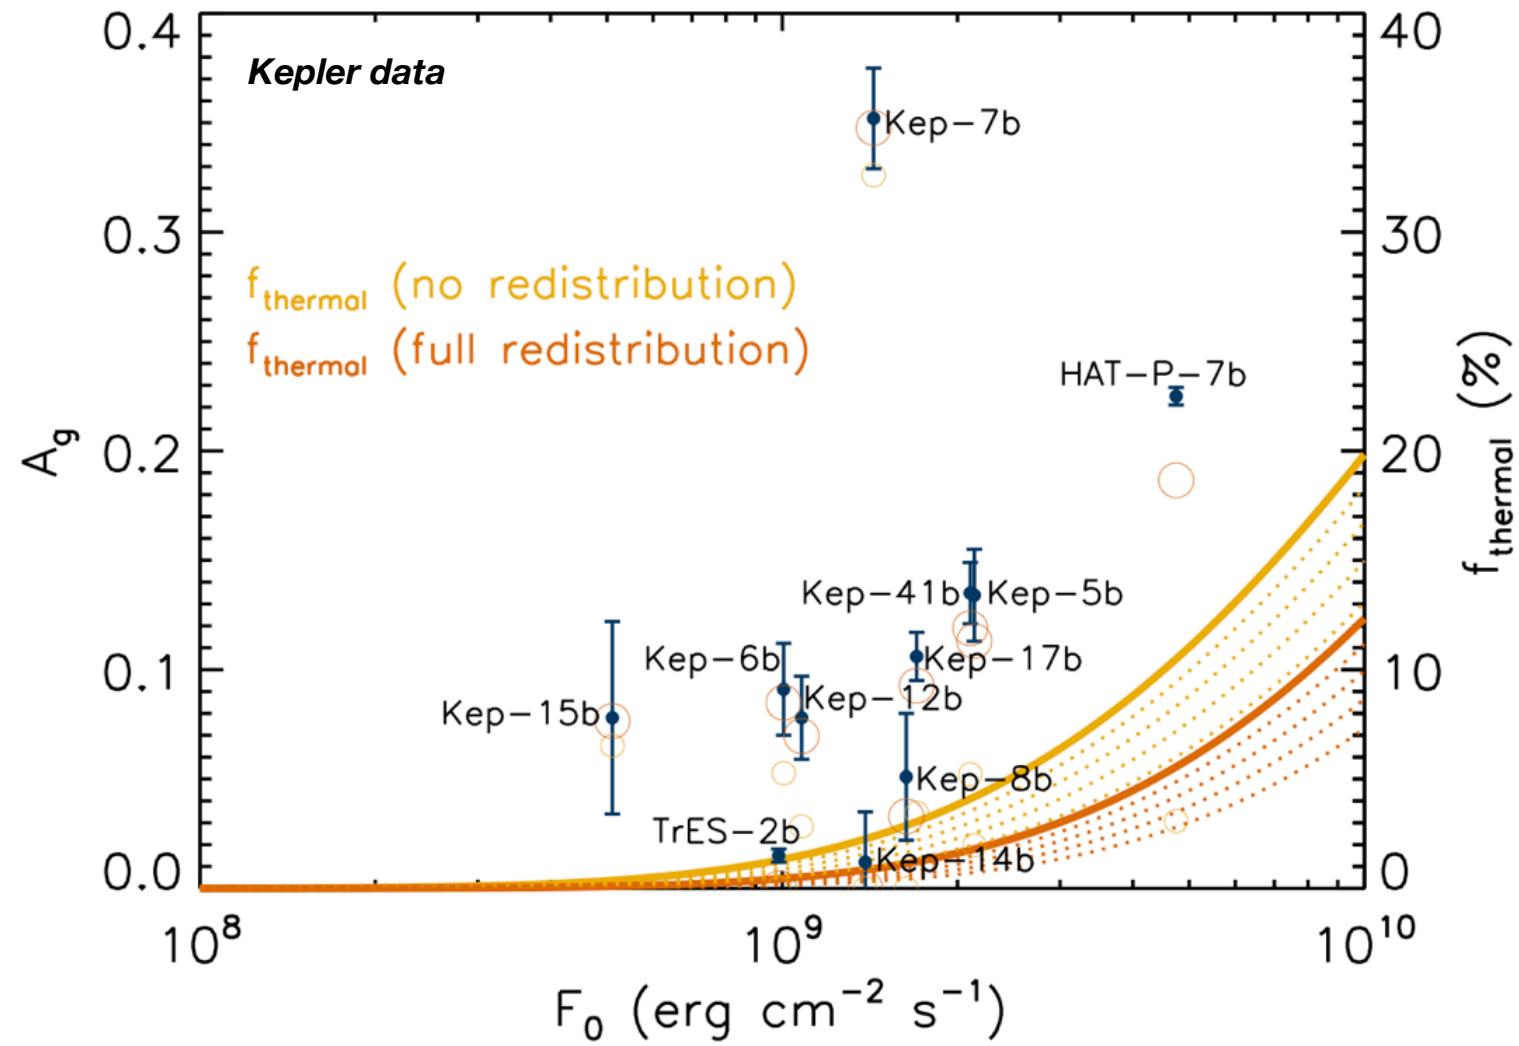

Clouds might become our limiting factor in exoplanet characterisation.

Basic properties of cloud formation

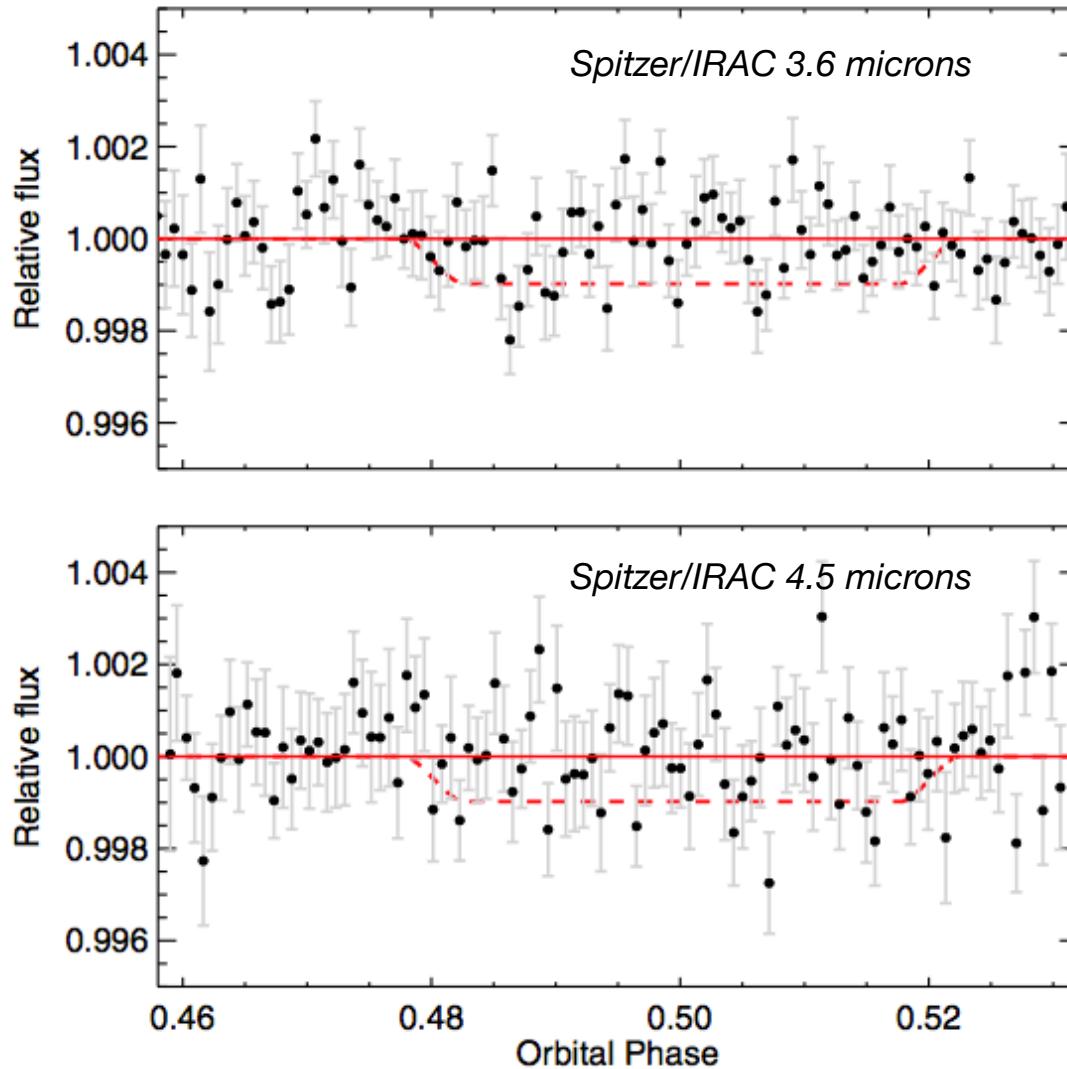

Adapted from Lodders 2004

The surprisingly large albedo of Kepler-7b

Heng & Demory 2013

Reflected light as the dominant source of A_g

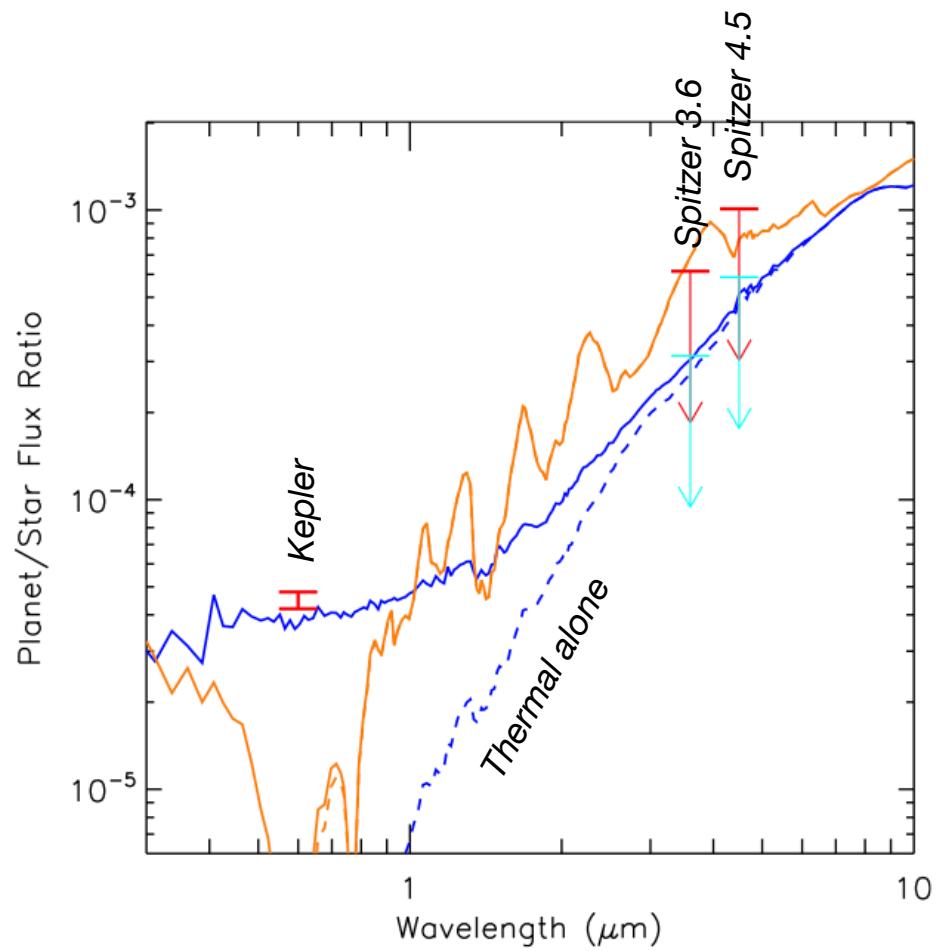

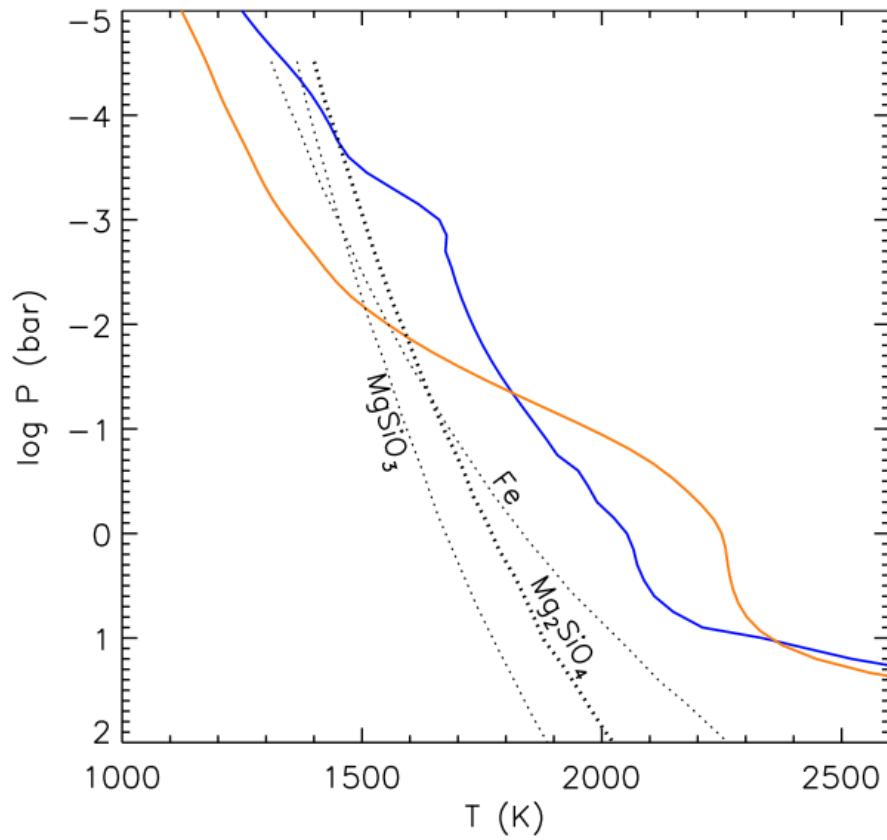

Kepler-7b

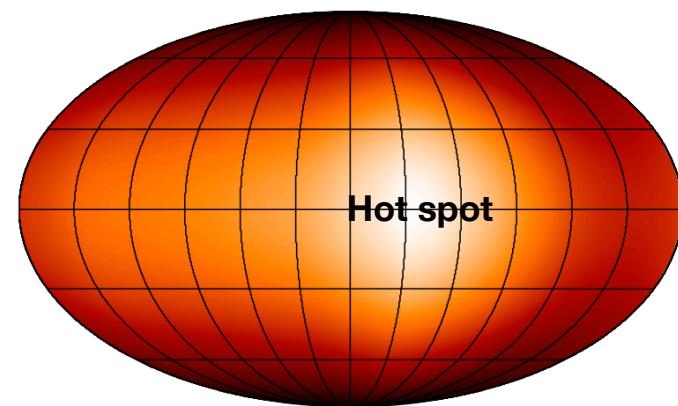

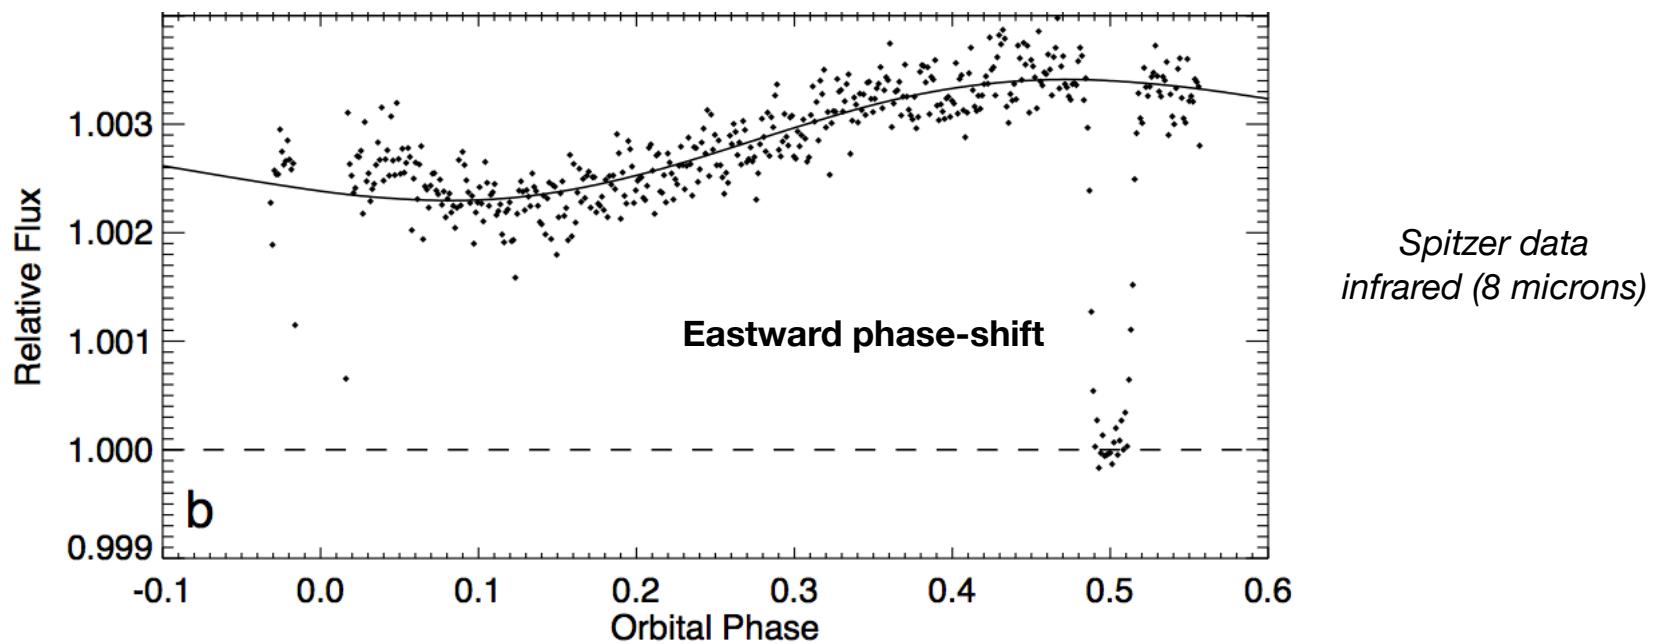

IR occultations with depths $\sim 2\text{mmag}$ were expected.

Therefore the origin of planetary light seen in the visible is not primarily of thermal origin.

Occultations: 1D nature of clouds

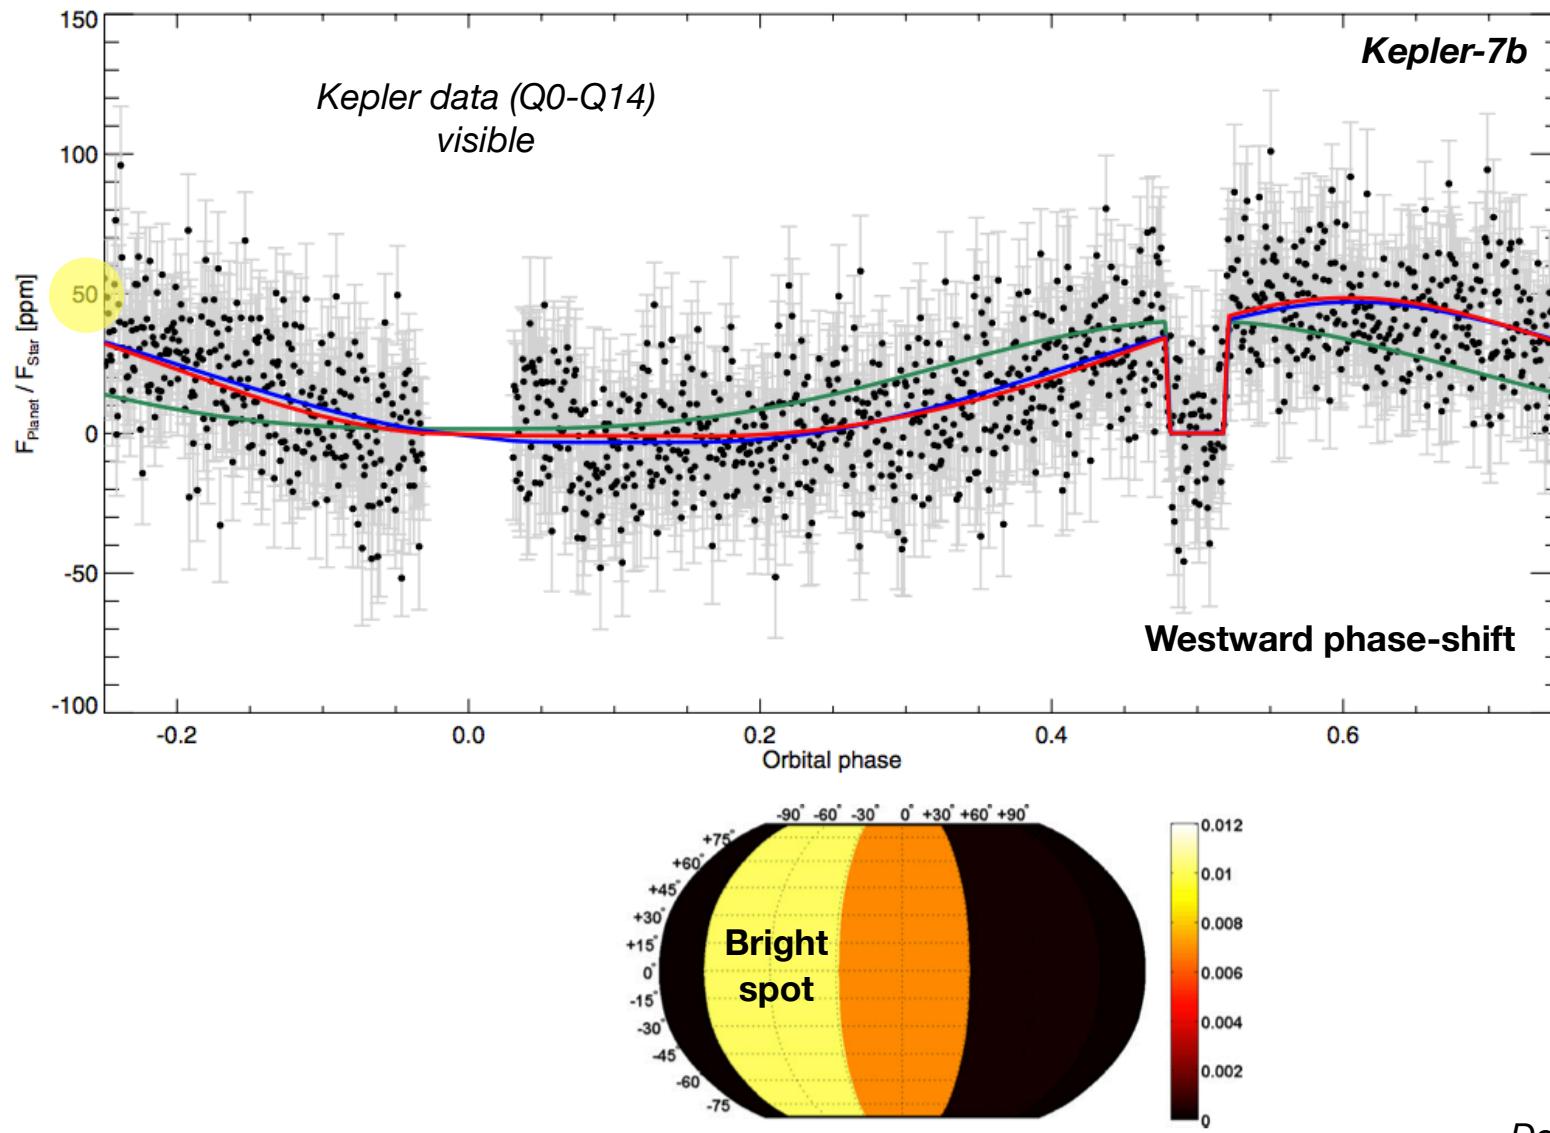

Infrared phase-curves: HD189733b

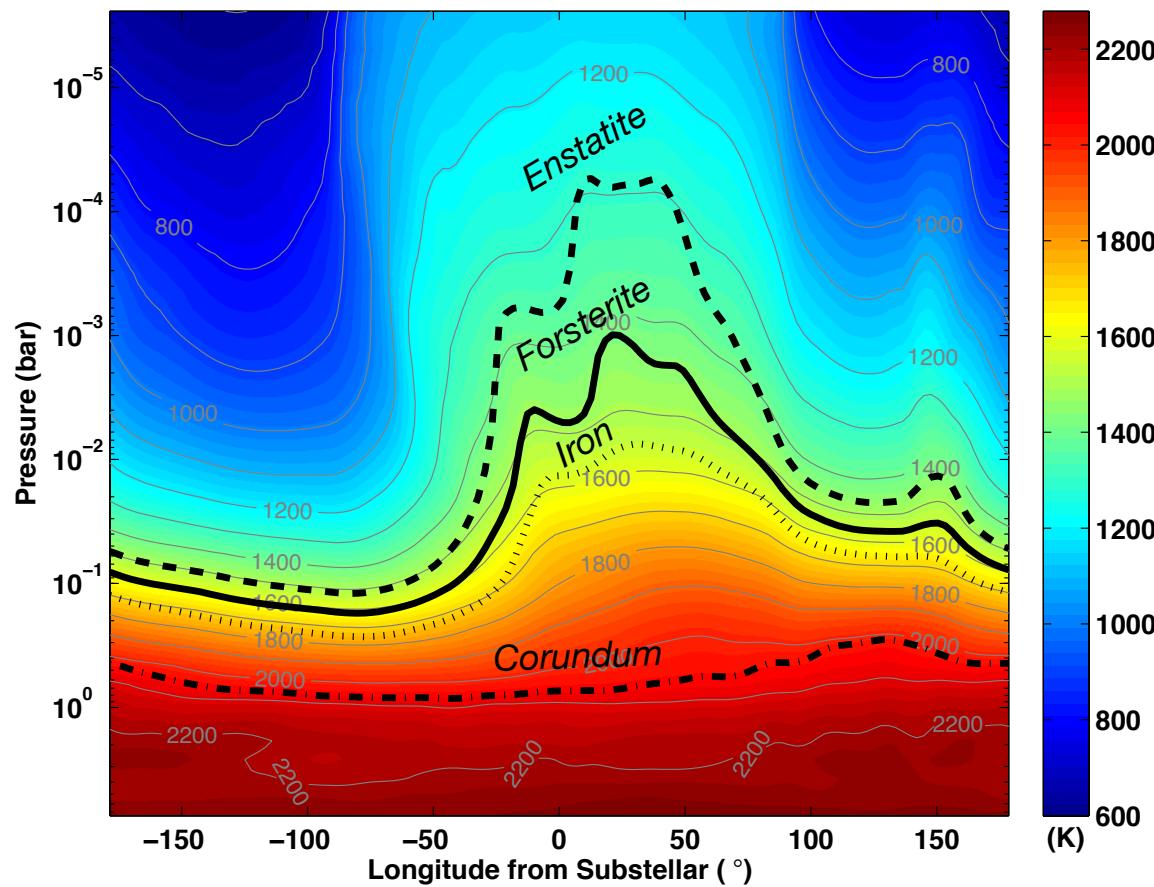

Knutson+ 2007

Optical phase-curves: 2D cloud distribution

GCMs: toward the 3D nature of clouds

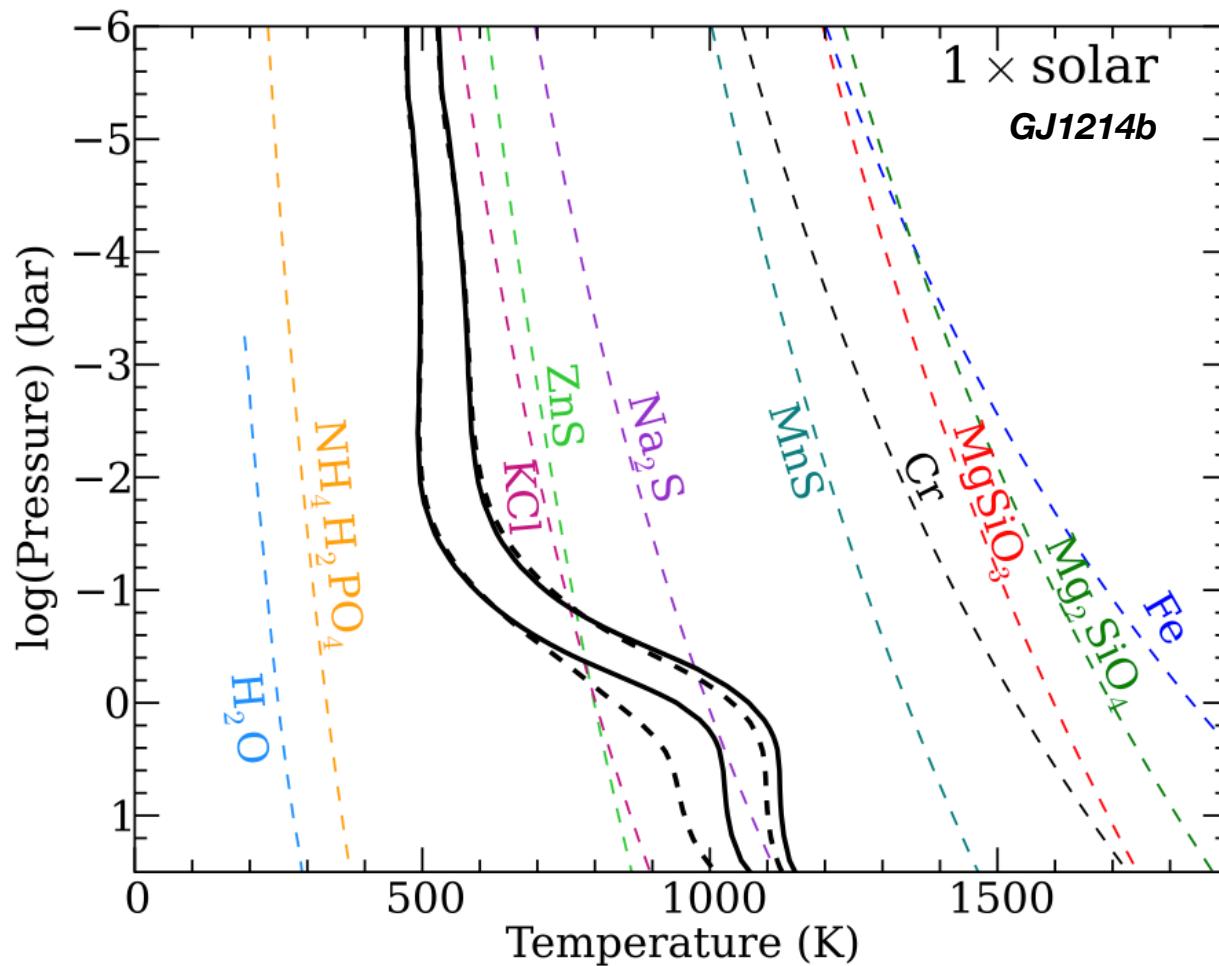

ELT: Key questions

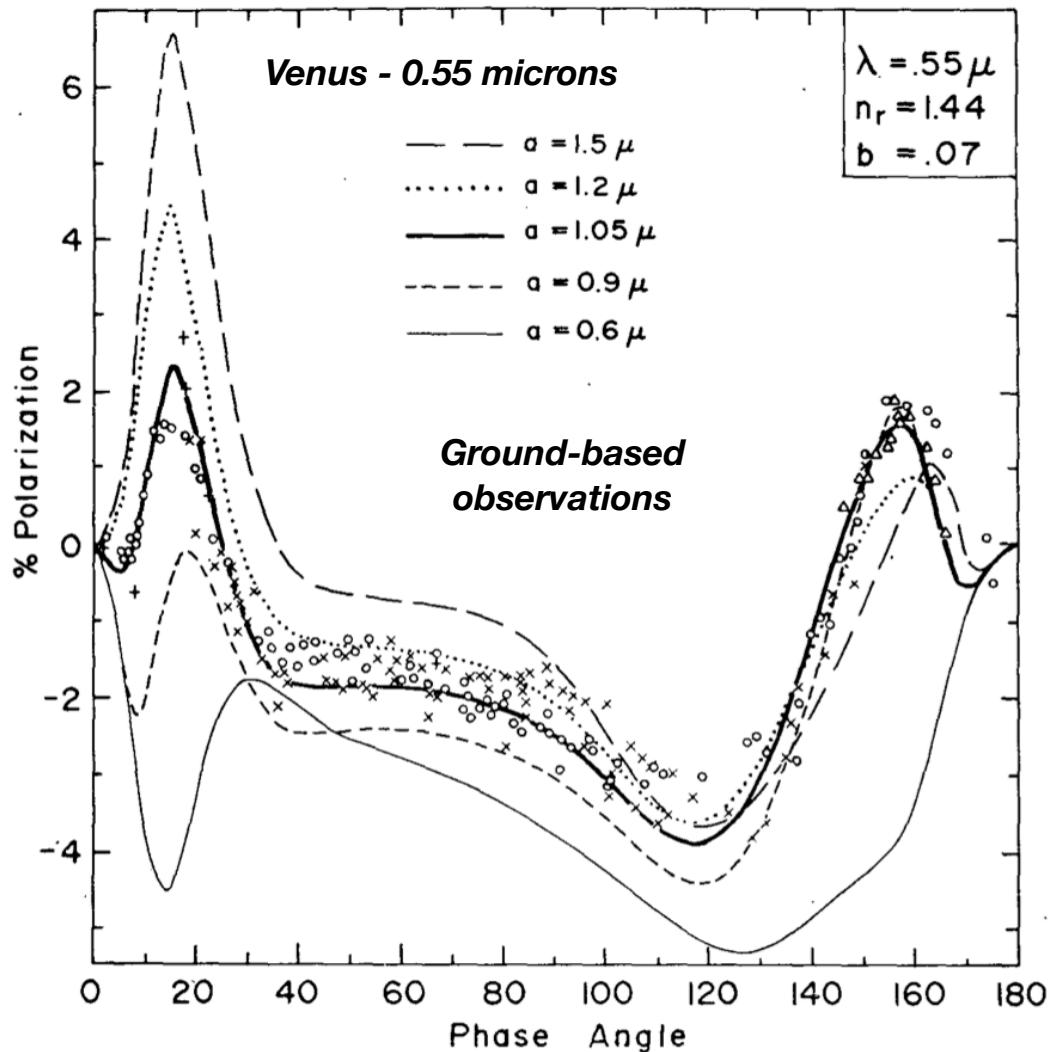

- How common are clouds on exoplanets?
- What is the range of planetary albedos?
- What are exoplanet clouds composition?

All of this for different planetary regimes, surface gravities, irradiation levels, etc.

ELT: Precise occultation photometry

ELT: the next step? polarimetry

- Refractive index and dispersion
- Particle shape
- Size distribution
- Pressure at the cloud tops

Multi-wavelength observations probably necessary to lift most degeneracies.
