

# 4MOST – 4m Multi-Object Spectroscopic Telescope

## Survey Strategy and 4FS

Peder Norberg (Durham University) & Jesper Storm (AIP)  
(4MOST Survey Strategy WG co-chairs)

9 July 2020

[www.4MOST.eu](http://www.4MOST.eu)

# Overview

- Basic concepts
  - 4MOST Field layout (LR and HR fibres)
  - Exposures, overheads, S/N
  - Observing conditions
  - Survey duration, feedback loops, catalogue changes
- 4MOST Facility Simulator (4FS):
  - 4FS WI (input): (consortium + community) survey catalogues + 4FS-ETC + 4FS-SoS
  - 4FS OpSim (sim): Visit Planner + Scheduler (long/short term) + Probabilistic Fibre-to-Target Assignment
  - 4FS Output (results)
- Area coverage and target densities, special areas
- Exposure times, conditions
- Cadence, variables and transients
- Supplementary Targets and Poor Observing Conditions programmes
- Summary

# 4MOST Field layout

Tempel et al. (2020)

- 1624 Low-Resolution Spectrographs fibres (LR)  $\Rightarrow \sim 400 / \text{deg}^2$
- 812 High-Resolution Spectrograph fibres (HR)  $\Rightarrow \sim 200 / \text{deg}^2$
- Number density of targets x exposure time must match between HR/LR

# Exposures, overheads, S/N

- Typical exposure times expected to be 5–30 mins
  - Longest ~30 mins limited by differential atmospheric refraction
  - Shortest possible 10s (but see overhead below!)
- After repointing of telescope, one or more exposures for total visit duration of 1.25h
- Each target can be exposed one or multiple times in a visit, each fibre can be repositioned between exposures
- Repeat exposures allows increased exposure time / S/N for each target individually
- Overheads:
  - Initial telescope slew, acquisition, fibre positioning: **3.5 min**
  - Each exposure (readout, calibrations, fibre repositioning): **4.4 min**
    - Extra calibrations needed because of tilting spines, may not be needed after initial calibration
  - Ongoing activities to reduce overheads

# Observing conditions

- Exposure times depend on:
  - Sky condition (bright/grey/dark)
  - Seeing
  - Airmass
  - Atmospheric transparency
  - S/N requested
- *4MOST users cannot choose observing conditions!*
- Exposure times will be estimated for standard conditions (see ETC talk by Genoveva Micheva and OpSys talk by Wing-Fai Thi)
- Exposure times adjusted as needed during simulations/operations (TBC)

# Survey duration, feedback loops, catalogue changes

- The first 4MOST survey will last 5 years
  - More 5-year surveys are foreseen to follow
- S/N success of all targets checked on ~weekly basis and return to the pool if not completed
- Progress at Survey level monitored on yearly timescale
  - Algorithms adjusted if needed when a Survey falls behind
- To ensure understandable selection function, catalogue changes will be kept to a minimum during the 5 years
  - A small number of Transients will be allowed per field (<2% of fibres)

# 4MOST Facility Simulator: Input

- Input to 4FS (4FS WI):
  - Target and Spectral catalogue package:
    - Coordinates, magnitudes,... and associated spectral templates
  - Spectral Success Criteria (SSC):
    - Rules and Rulesets defining spectral requirements
  - “FoM” package:
    - Small Scale Merit (SSM) function: encodes completeness requirements on scales of  $\sim$  4MOST FoV
    - Large Scale Merit (LSM) map: encodes priority sky areas for each Survey
    - Required Area and Tmax: encodes requested area and maximum exposure time
- Survey can consist of multiple sub-surveys:
  - each with its individual target and spectral package, SSC and FoM package
  - Typically sub-surveys contain objects with similar selection criterion -> *sub-survey selection function*
- Minimal cadence input (in progress: expects to be delivered when 4FS WI goes online)

# 4MOST Facility Simulator: Input

- Input to 4FS (4FS WI):
  - Target and Spectral catalogue package:
    - Coordinates, magnitudes,... and associated spectral templates
  - Spectral Success Criteria (SSC):
    - Rules and Rulesets defining spectral requirements
  - “FoM” package:
    - Small Scale Merit (SSM) function: encodes completeness requirements on scales of  $\sim$  4MOST FoV
    - Large Scale Merit (LSM) map: encodes priority sky areas for each Survey
    - Required Area and Tmax: encodes requested area and maximum exposure time
- Survey can consist of multiple sub-surveys:
  - each with its individual target and spectral package, SSC and FoM package
  - Typically sub-surveys contain objects with similar selection criterion
- Minimal cadence input (in progress: expects to be delivered when 4FS WI goes online)

**See Wing-Fai Thi's OpSys talk on Friday  
and Jake Laas 4FS WI tutorial on Tuesday**

# 4MOST Facility Simulator

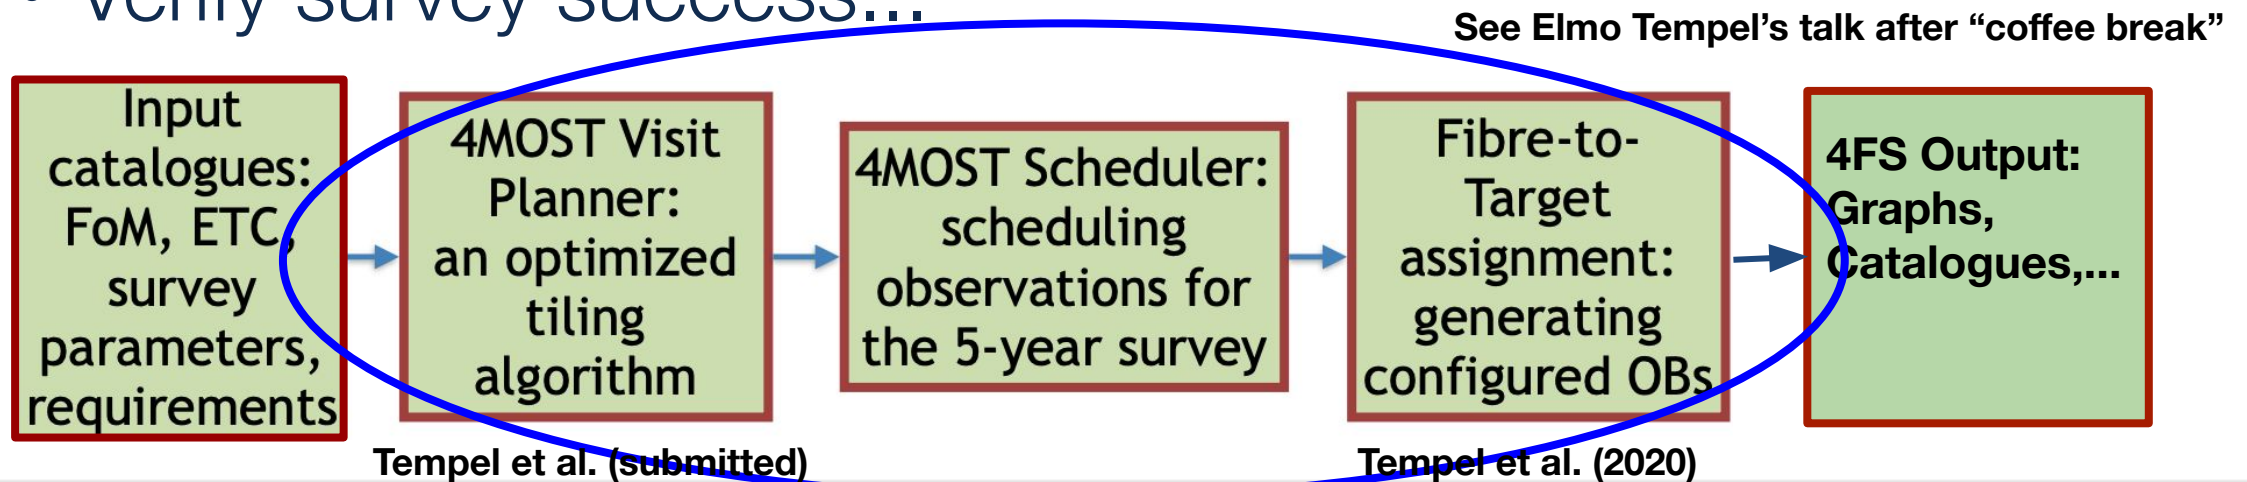

- Take ETC estimate on each target (see talk by GM & WFT)
- Decide tiling, observing conditions, fibre-target assignment
- Run 5-year survey strategy with all surveys
  - Observing conditions: seeing, wind, clouds, down-time, ...
- Verify survey success

# 4MOST Facility Simulator

- Take ETC estimate on each target (see talk by GM & WFT)
- Decide tiling, observing conditions, fibre-target assignment,...
- Run 5-year survey strategy with all surveys
  - Observing conditions: seeing, wind, clouds, down-time, ...
- Verify survey success...

# 4MOST Facility Simulator output: single run

## 4MOST Selection Functions Pipeline: Plot collections

R15: Year 1   R15: Year 2   R15: Year 3   R15: Year 4   **R15: Full Survey**

### R15: Full Survey

ID	Res	Collection	Count	All targets	Successful	Successful / all	Exp. time (dark)	Magnitude	Exp. time (dark)	Ang. sep. (small)	Loc. den. (512)	Survey progress

OpSim pages for this sub-survey, for each run compared to

Table of contents

- [Metrics computed from input catalogues](#)
  - [1. Map of the Large Scale Merit \(LSM\) function](#)
  - [2. Sky density of all targets](#)
  - [3. Sky density of fibre-hours requested](#)
- [Metrics computed from output catalogues](#)
  - [4. SoS Figure of Merit \(SoS FoM\)](#)
  - [5. Alternative merit measure](#)
  - [6. Fraction of sky pixels that reached the required completeness level](#)
  - [7. Number of targets that have been completed](#)
  - [8. Number of targets that have been observed at least once but not completed](#)
  - [9. Number of targets that have been observed at least once](#)
  - [10. Contiguous sky area that reached the required completeness level](#)
  - [11. Sky area that reached the required completeness level](#)
  - [12. Sky area touched by observations](#)
  - [13. Sum of the Small Scale Merit \(SSM\)](#)
- [Glossary of terms](#)
- [Explanation of metrics](#)

# 4MOST Facility Simulator output

- For surveys, sub-surveys and total:
  - Statistics of input catalogues
  - Output statistics of runs: observed/completed/unobserved total & fractions
  - 1D distributions: B/G/D exposure times, magnitudes, ...
  - 2D sky distributions: completeness, ...
  - Progress reports: FoMs, (contiguous) sky coverage, ...
- For multiple simulation runs:
  - Comparisons between runs for the same survey

# Scientific and SoS Figure of Merit (FoM)

- Two important concepts to capture actual survey progress:
  - **SoS Figure of Merit** (SoS FoM): encodes overall success of a sub-survey via a fixed metric depending on SSM, LSM and area\_requested and sub-survey progress.
  - **Scientific Figure of Merit**: encodes overall success of a sub-survey via a survey defined metric and sub-survey progress. *The scientific FoM needs to be defined in the Survey proposals.*
- *Scientific FoM* and *SoS FoM* are defined for each sub-survey and overall for a survey.
- **Both Scientific FoM and SoS FoM are key ingredients to measure survey progress.**

# What area can 4MOST cover in 5 years?

- 5 years x 300 nights/year x 9h/night x 4.2 degree<sup>2</sup> FoV
- Assume 0.75 open shutter fraction and 2h per pointing
- This allows you to cover ~21000 degree<sup>2</sup>
  
- Area roughly equivalent to a nominal survey area of  $-70^\circ < \text{Dec} < 5^\circ$   
(to be visited twice with 3x20 min exposures reaching 2h total)
- Observing outside this area or exposing longer than 2h in certain areas means:
  1. reducing exposure time somewhere else in this nominal area or
  2. not covering certain areas at all in this nominal range

# Area coverage and target densities for consortium surveys

## Low Resolution

## High Resolution

- Catalogues have more targets than needed: requested completeness sets the number of targets each survey is interested in.
- *Catalogues are still being worked on in the details.*
- *Hereafter: simulation results assume catalogues limited to  $-80^\circ < Dec < 5^\circ$*

# Requested dark exposure time and available exposure time for consortium surveys in an example OpSim run

## Low Resolution

## High Resolution

Requested

Available

- *Catalogues are still being worked on in the details.*

# Corresponding observing success rates...

Number of  
successful spectra

## Low Resolution

## High Resolution

Observing  
success rate

- *Catalogues are still being worked on in the details.*

# Corresponding SoS Figure-of-Merit progress

SoS Figure of Merit per sub-survey

From this example OpSim run, some sub-surveys do not reach their nominal SoS FoM.

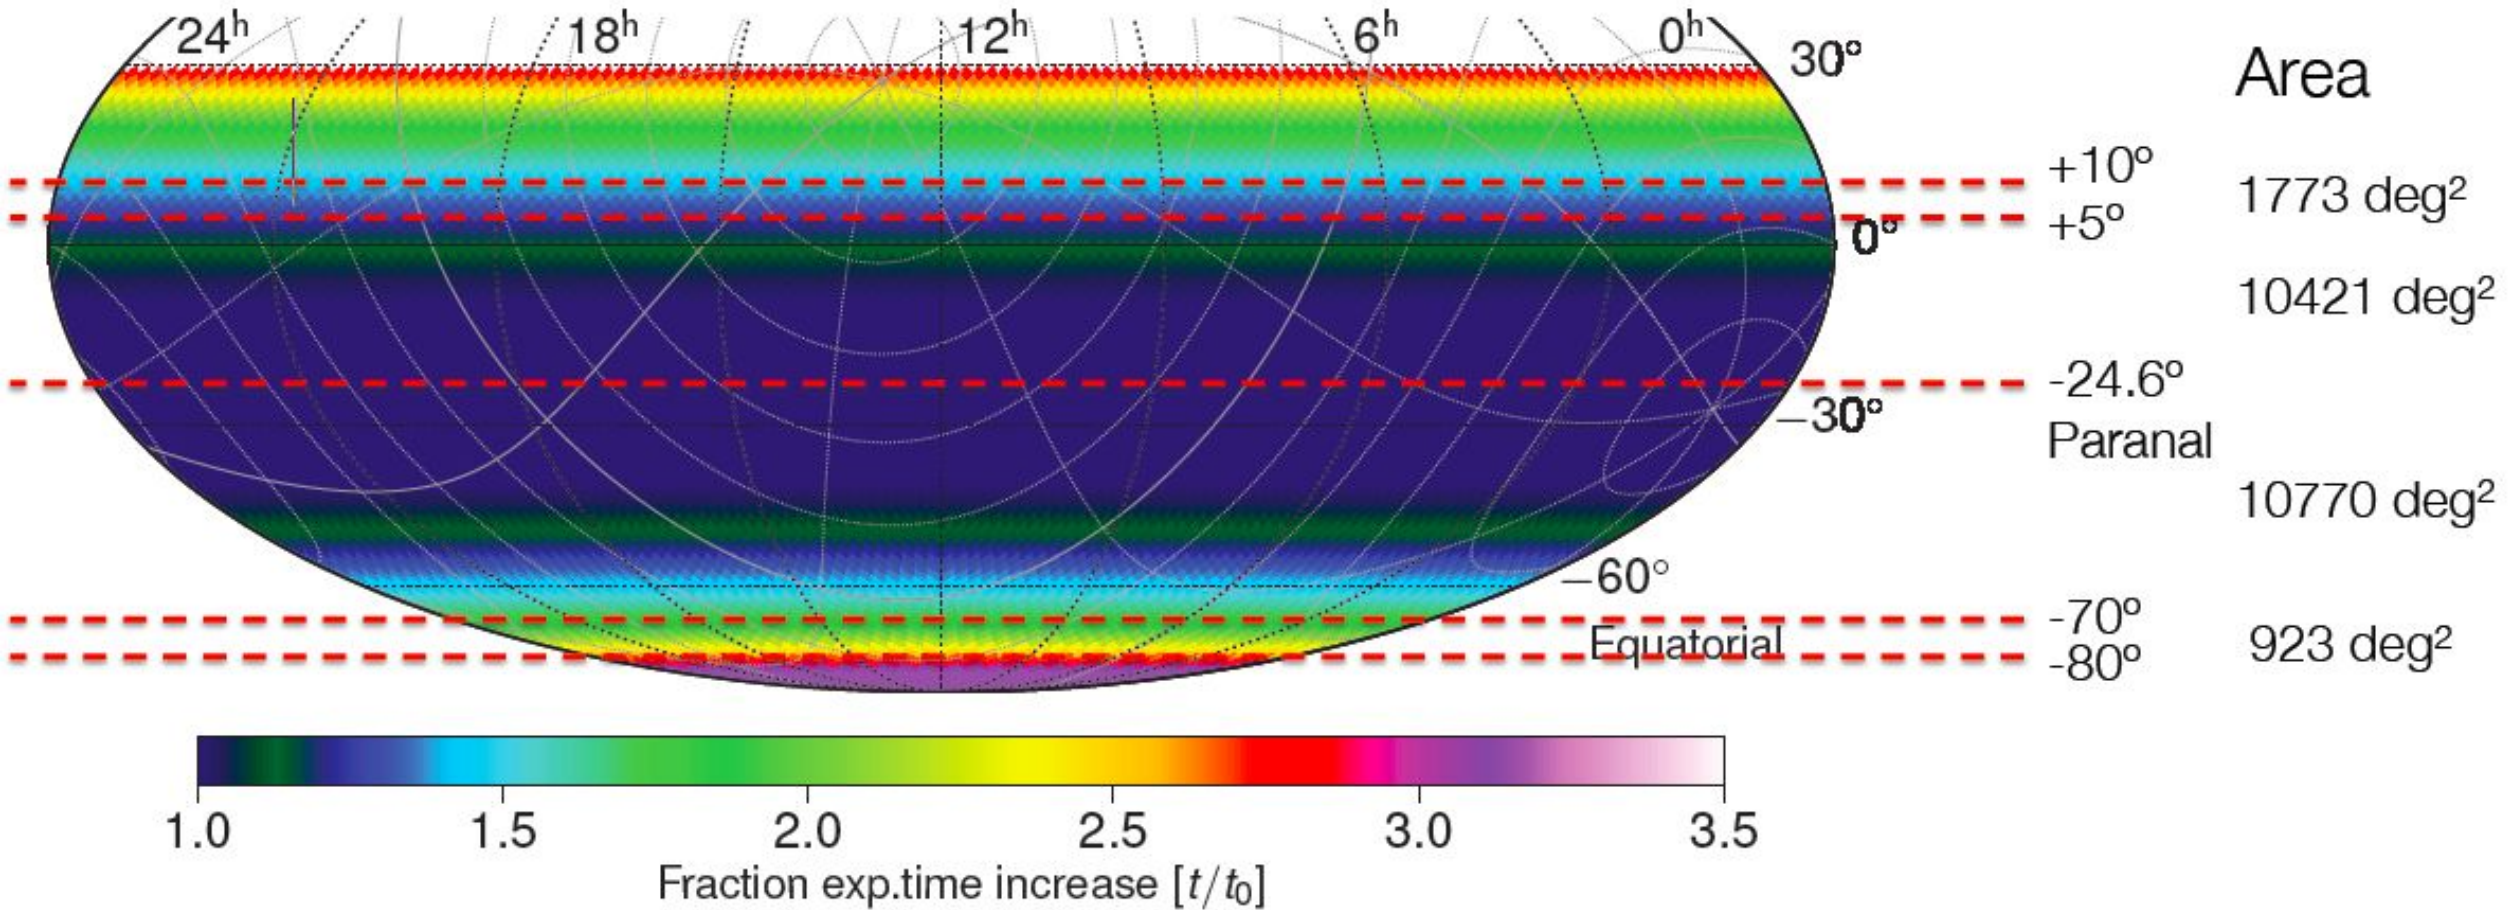

This is *not yet* a concern:

- surveys working on catalogues
- first OpSim run including a model mimicking 30% community time.

SoS FoM has a fixed format, defined by 4FS WI input (LSM, SSM, area\_requested) and survey progress.

Plots with scientific FoM in progress.

# Where to point, when accounting for overall 4MOST observing efficiency?

Atmospheric Dispersion Compensator limit (55° ZD) => -80° to +30° are “instrument” limits

# Sky transparency suggests $-70^\circ \leq \text{Dec} \leq 20^\circ$

1a. Observing efficiency rapidly decreases at higher airmasses due to decreasing sky transparency:

- $m(\lambda) = m_0(\lambda) + \kappa(\lambda) X(z)$
- Atmospheric extinction effects worst in the blue

passband	mag/airmass
U	0.6
B	0.4
V	0.2
R	0.1
I	0.08

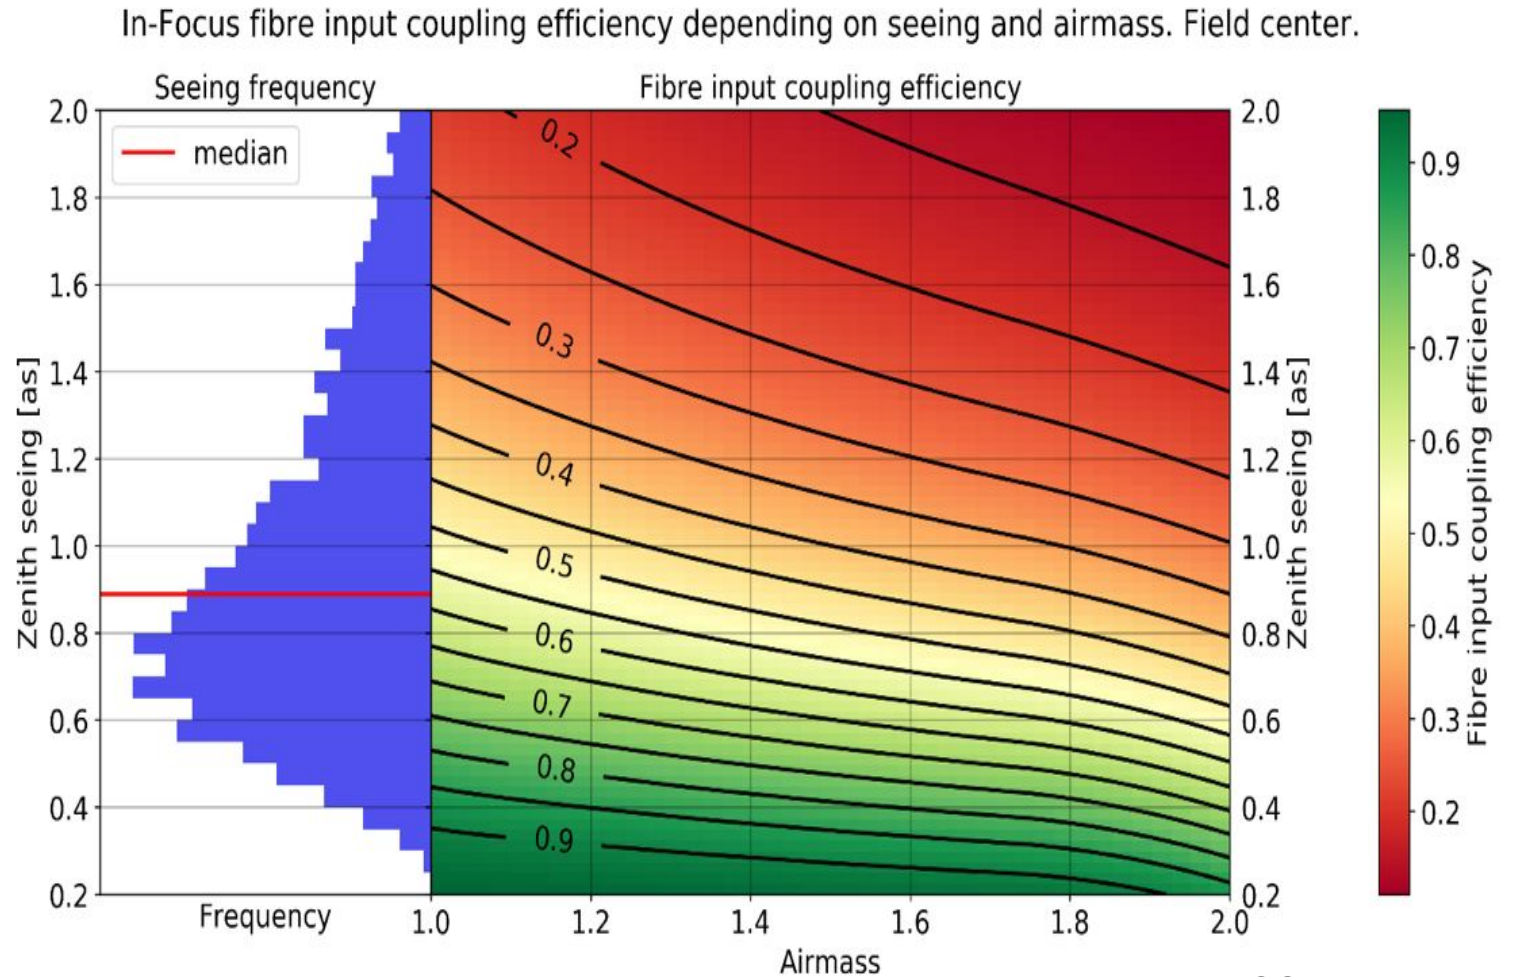

# Image quality suggest $-70^\circ \leq \text{Dec} \leq 20^\circ$

## 1b. Worsening image quality

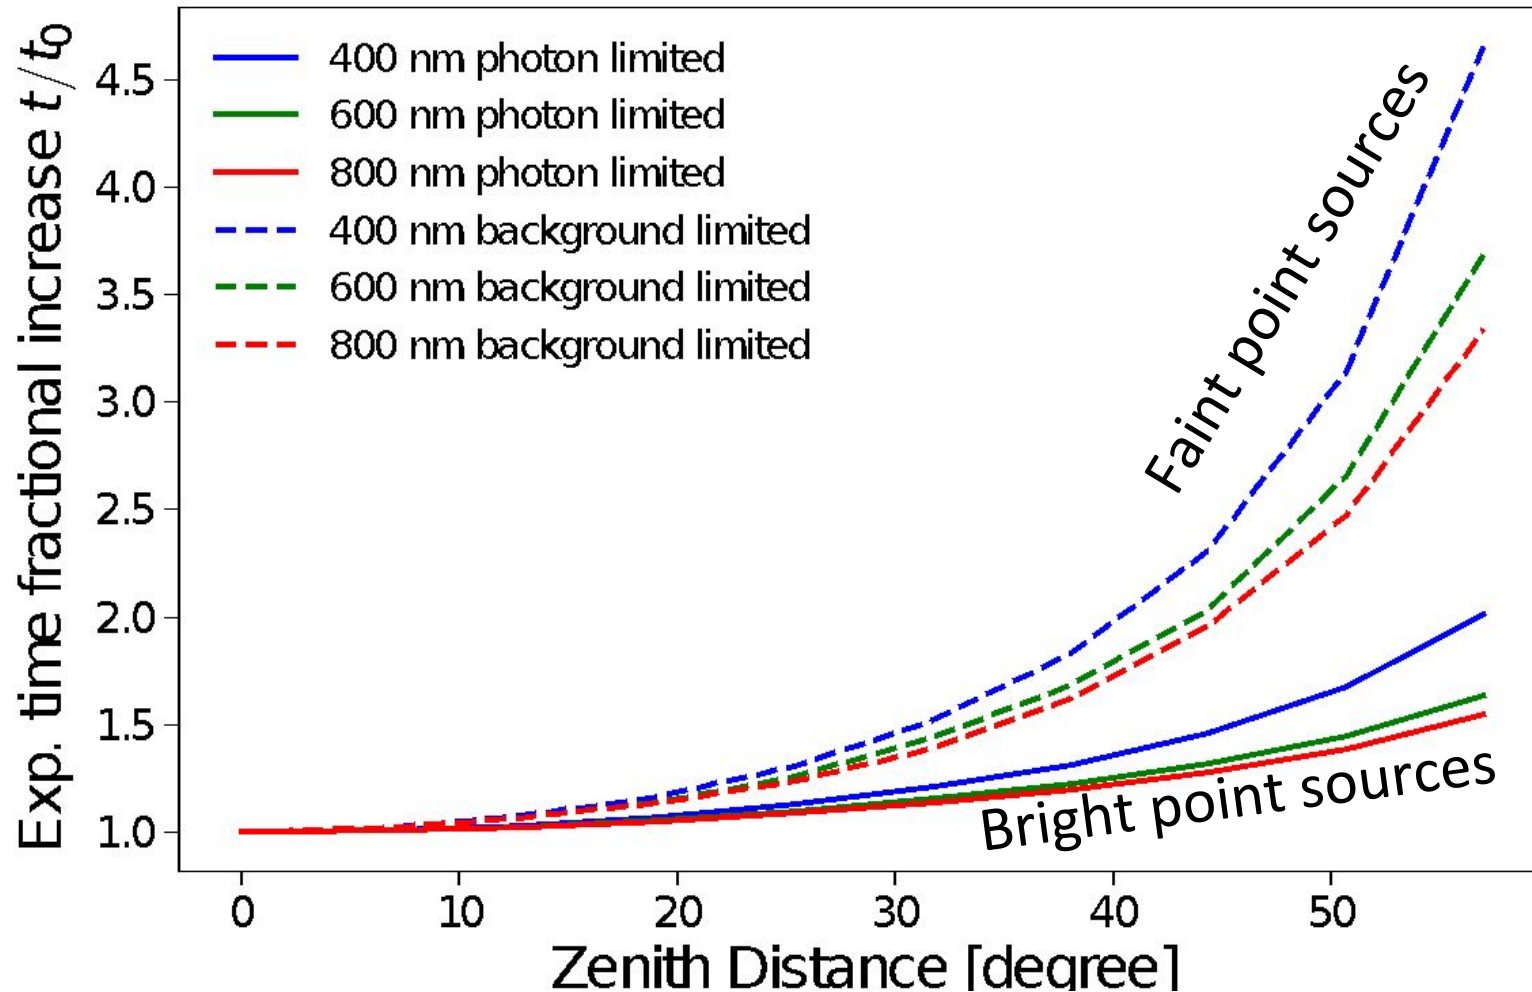

Image quality and hence light coupling in fibre depends on wavelength and airmass:

$$FWHM(\lambda) \propto AM^{\frac{3}{5}} \cdot \lambda^{-\frac{1}{5}}$$

Winkler -- 4MOST doc

# Observing Efficiency suggests $-70^\circ \leq \text{Dec} \leq 20^\circ$

- Exposure time increases with airmass to get same S/N
- Extended sources somewhat less affected

# Prevailing northern winds suggests Dec $\leq 5^\circ$

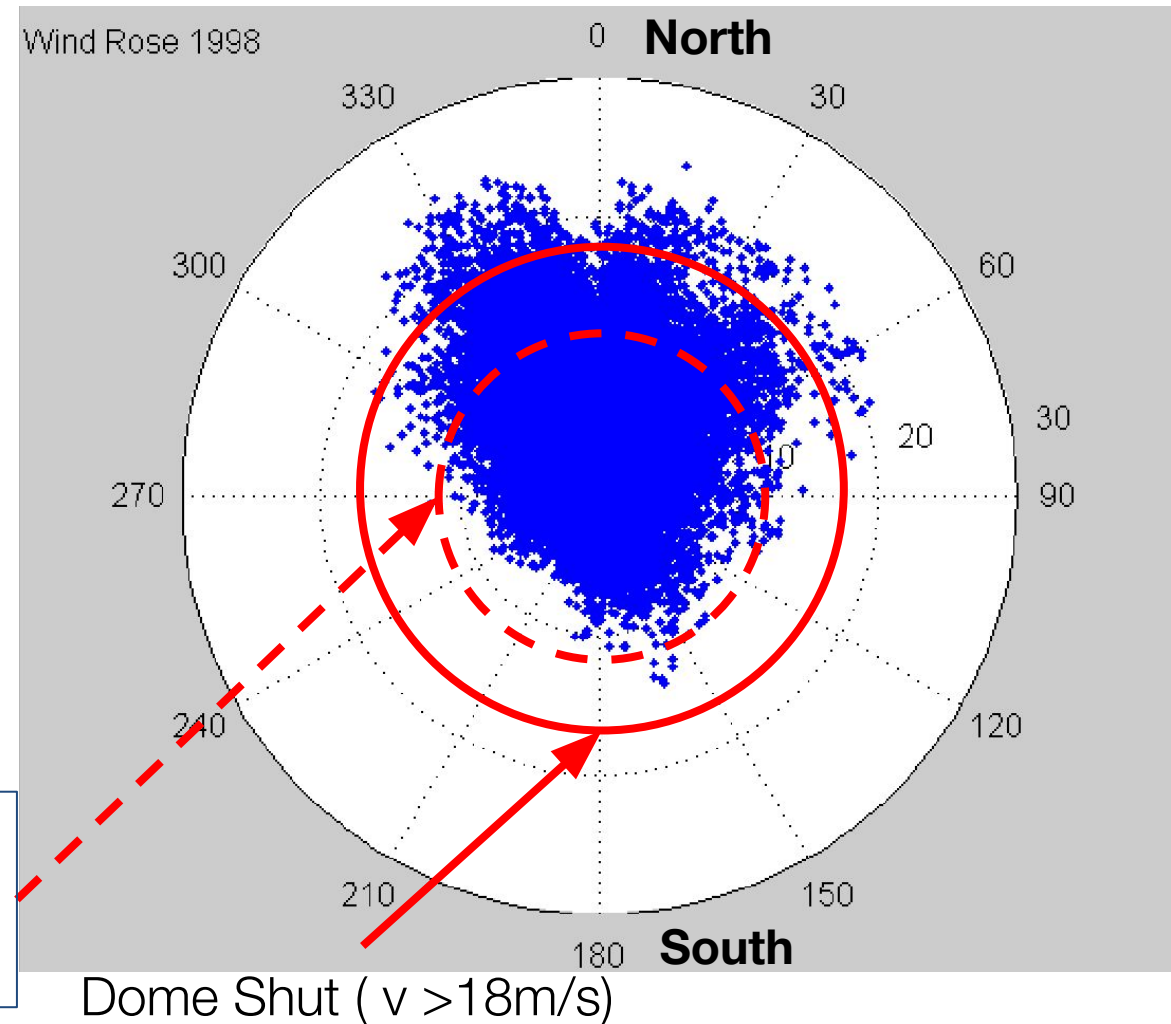

## 2. Northern winds

Prevailing strong northern winds results in northern regions (dec > -24.6) harder to schedule.

Together with worsening observing efficiency at higher airmasses, regions north of dec =  $5^\circ$  are not recommended.

Telescope can't point towards wind direction ( $v > 12\text{m/s}$ )

# Prevailing northern winds suggests Dec $\leq 5^\circ$

## 2. Northern winds

Prevailing strong northern winds results in northern regions (dec > -24.6) harder to schedule.

Together with worsening observing efficiency at higher airmasses, regions north of dec =  $5^\circ$  are not recommended.

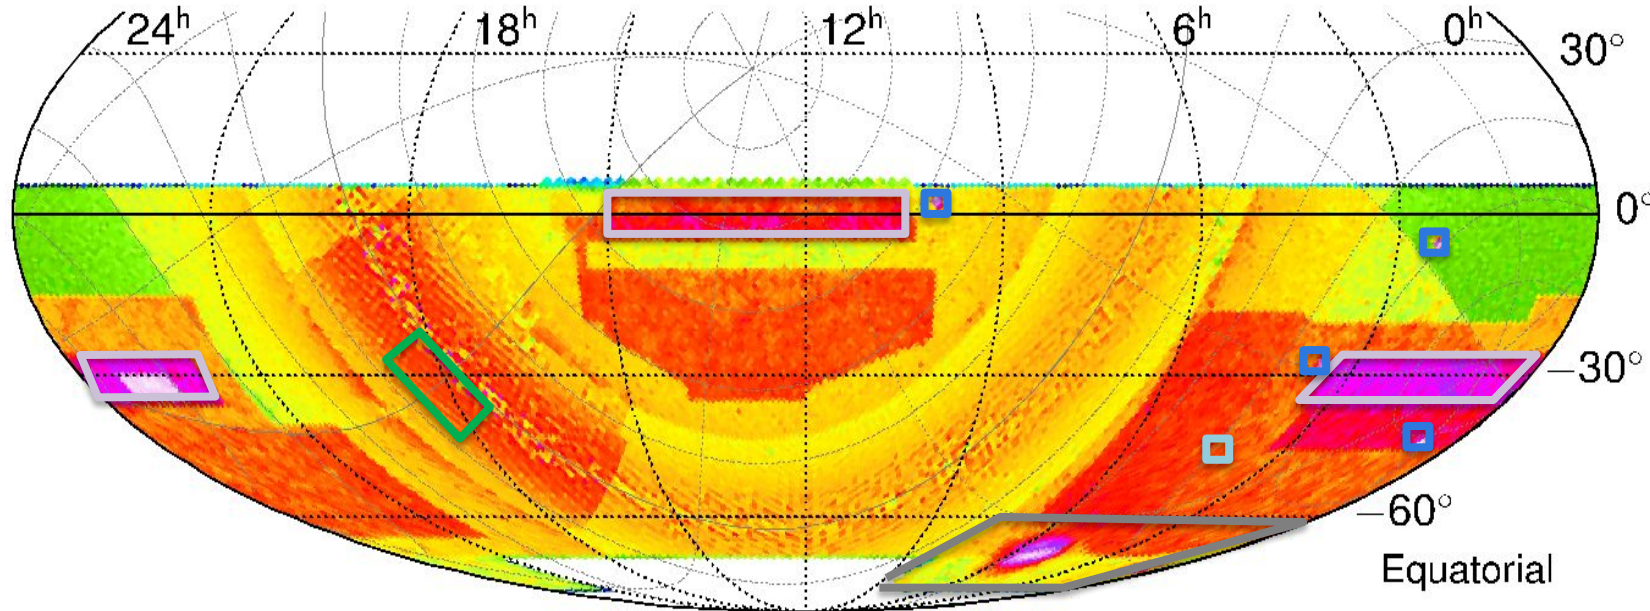

# Three reasons to recommend $-70^\circ \leq \text{Dec} \leq 5^\circ$ :

1. Observing efficiency
  2. Northern winds
  3. Other facilities in the North
    - WEAVE
    - DESI
    - PFS
    - (but need to coordinate overlap)
- Preference:
    - stay within  $-70^\circ \leq \text{Dec} \leq 5^\circ$  or even narrower
    - Add time/targets  $\text{Dec} < -24.6^\circ$

# Special areas in use by consortium surveys

- Preference: use special areas if you
  - want to go very faint or high S/N
  - want repeats to study objects with a certain cadence for variability

Location	Area (deg <sup>2</sup> )	Average $t_{\text{exp}}$ (hours)
Bulge and Inner Galaxy	500	4–6
Magellanic Clouds	200–300	2–10
WAVES-Wide	1300	3–4
WAVES-Deep	50	7
LSST Deep Drilling Fields	4x 4.2	4x 60
South Ecliptic Pole area	300	4

# Cadence, variables, transients

- *4MOST does not allow for timed observations!*
  - The survey nature clashes with individual target needs
- Limited set of deep/repeat fields that will be observed with a certain cadence (~once every 2 weeks)
- Some areas may be re-observed on purpose with a minimum amount of time in between (~12 months) to check for variability (e.g., radial velocity binaries)
- Contiguous areas will be completed as quickly as possible to measure large scale spatial structures
- 4MOST may adapt some of the cadence strategy to mimic/follow LSST (e.g., rolling Dec cadence)
- A small fraction of transients may be added on ~weekly time scale to be observed in the coming weeks
  - This will not drive the pointing of the telescope significantly; transients will be observed wherever observations are scheduled

# Supplementary target programme

## Poor observing condition programme

- Consortium Surveys designed to have an over-abundance of targets from Surveys not requiring high local spatial completeness
- Empty fibres expected still after all targets from main Surveys have been allocated
- Need for a “Supplementary Targets Programme” with following properties:
  - No requirements on any completeness (spatial, magnitude, redshift)
  - No requirements on total and/or fraction of completed targets
- Not to be used statistically, but may be ideal for serendipitous rare object discovery
- All participating surveys will be requested, after proposal selection, to provide input targets for this “Supplementary Target Programme”.
- Poor observing condition programme: quick (~2 min exposures) survey of most bright stars, e.g.  $5 < G < \sim 11.5$  mag (HRS) &  $11 < G < \sim 13$  mag (LRS), within 4MOST footprint.
- Opportunities of science cross calibrations with other instruments/surveys

# Summary of Survey Strategy (I)

- Survey strategy of 4MOST will consist in combining the requests of:
  - 10 consortium surveys with a total of ~40 sub-surveys
  - A large number of participating surveys and sub-surveys (at most 17 surveys)

=> Not an easy task :) , but...
- 4MOST has:
  - 4FS WI: survey input ingestion portal with ETC (Genoveva, Thi and Laas' talks)
  - 4FS OpSim: a comprehensive survey simulation pipeline (Tempel's talk)
  - 4FS Output: a pipeline of survey progress monitoring

=> So it is possible, while still not easily done :)

# Summary of Survey Strategy (II)

- Key messages for survey strategy to work:
  - *Vital that input catalogues and spectral requests are reasonable:*
    - => *SoS Fibre Hour (SoS FH) estimate is a lower limit of actual needs (ignores most complications only possible to estimate through full simulation work).*
    - => *Do not expect to use less Fibre Hours than estimated by SoS.*
  - *Nearly all survey cross talk with each other to some more or large extent:*
    - => *understanding how other surveys target similar areas can be extremely helpful and informative for every survey*
    - => *issues with one survey can impact all surveys, as 4MOST tiling depends on all survey inputs and requests.*
