

# Short intro to ALMA and interferometry

Elisabetta Liuzzo, Marcella Massardi, Carmen Toribio

ALMA Science Archive School  
Italian ARC node headquarters, 5-7 October 2022

# What is ALMA?

It is an ambitious project

The **Atacama Large Millimeter/submillimeter Array (ALMA)** is a

**reconfigurable interferometer**

observing at **millimeter and submillimeter wavelengths**

in the **Atacama Desert of northern Chile**

Latest Cycle 9 capabilities [here](#)

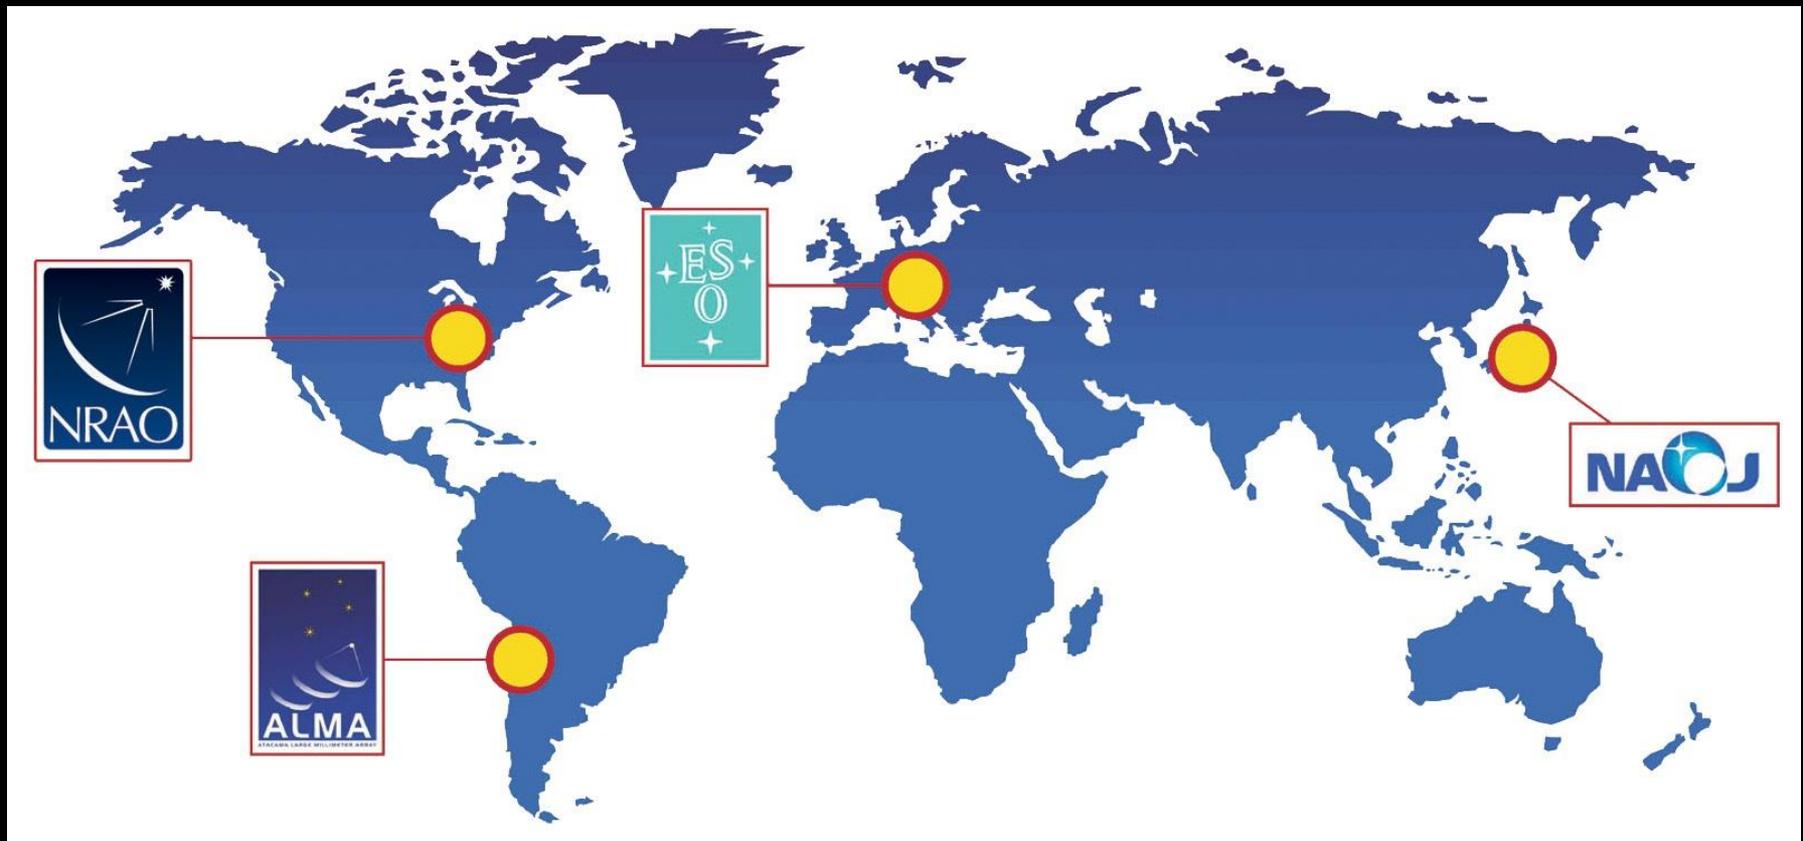

# ALMA organization

## World wide Collaboration

- Europe: **ESO** (14 countries)
- North America: **NRAO** (USA, Canada)
- East Asia: **NAOJ** (Japan, Taiwan)
- Chile

Contributors share the observing time

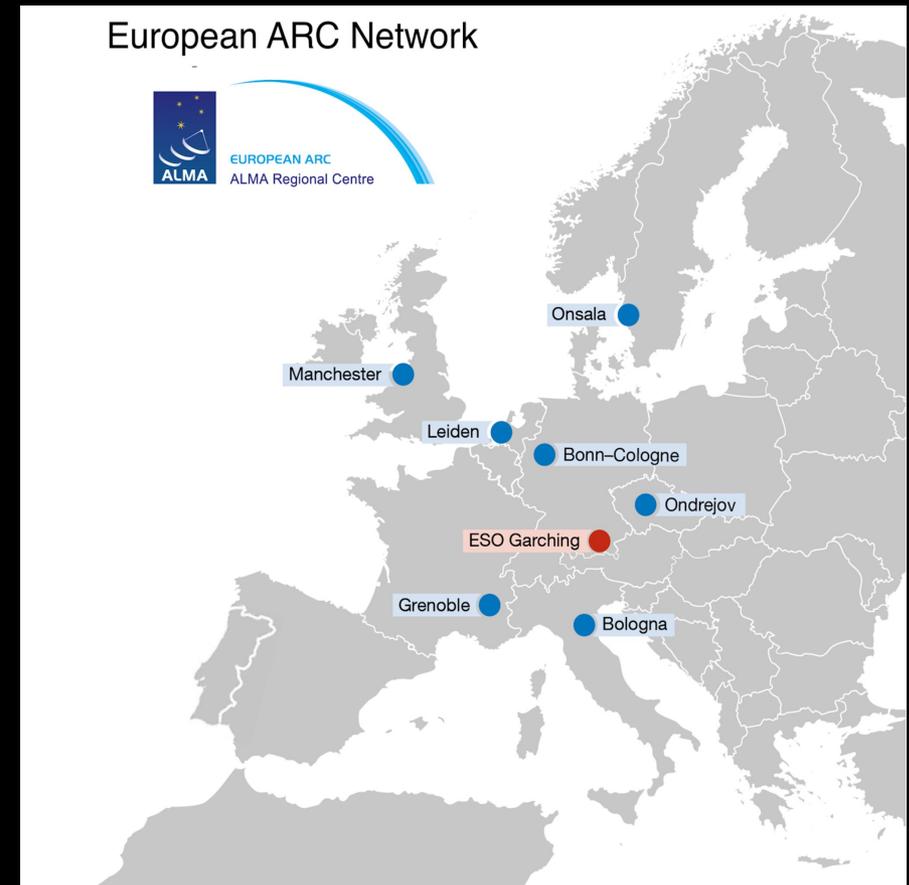

## ALMA regional centers (ARCs)

- *Interface between observatory and users*
- 1 ARC per Partner
  - NRAO for North America
  - NAOJ for East Asia
  - ESO for Europe (split in 7 nodes)

## The European ARC nodes

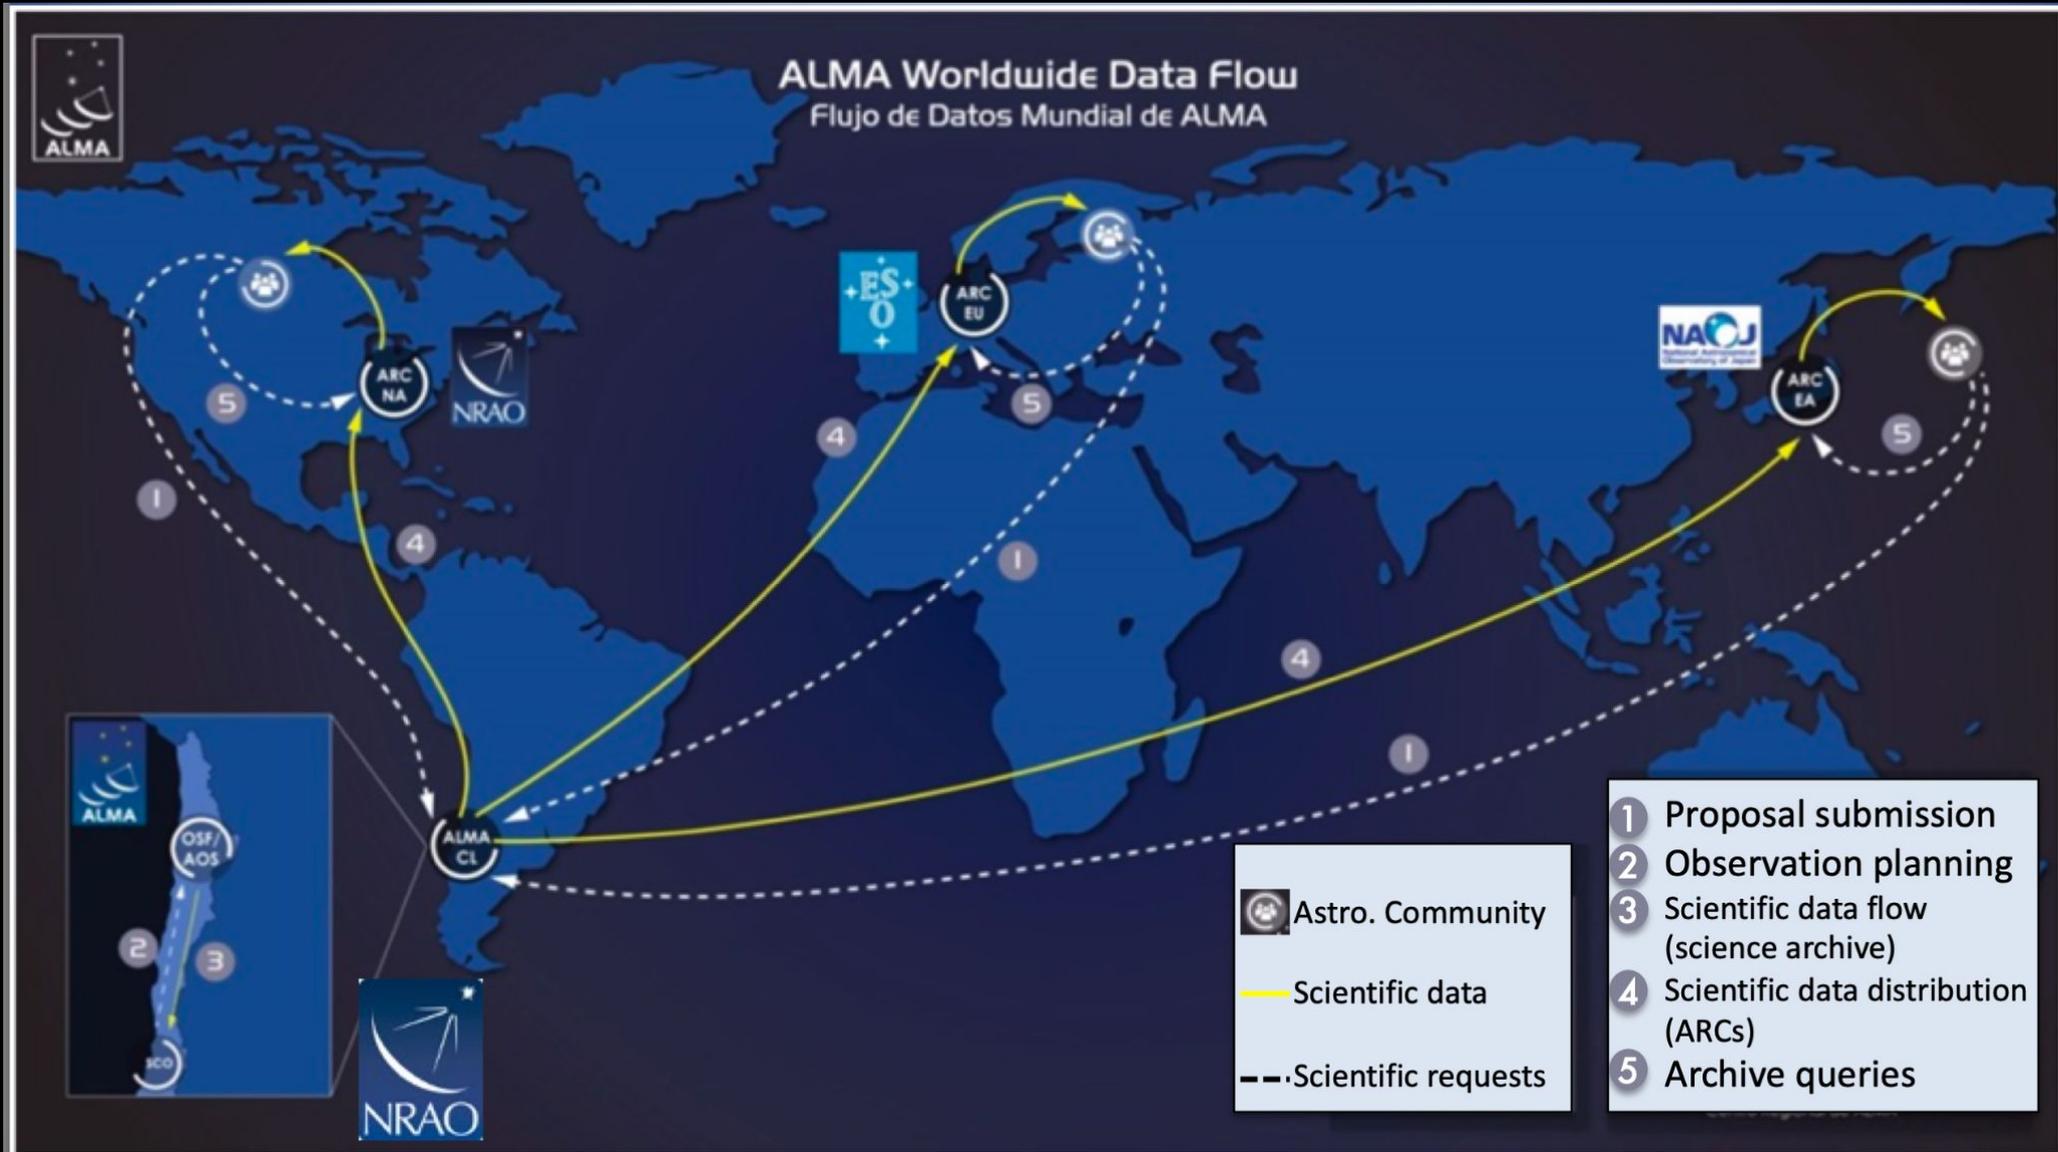

- *Operation support*
  - Archive replication
  - astronomer on duty
  - software tools
- *User support*
  - Community formation and outreach
  - from proposal preparation to observation
  - archive mining
  - f2f and advanced user support
  - Quality assessment

**!!! Improving the ALMA User experience !!!**

# ALMA data flow

Each ARC hosts an **archive mirror**

ALMA Basics ALMA Archive

**Registration to Helpdesk, access project management tools, to be co-I or PI**

# Why ALMA? The main 'science drivers' (level 1 science goals)

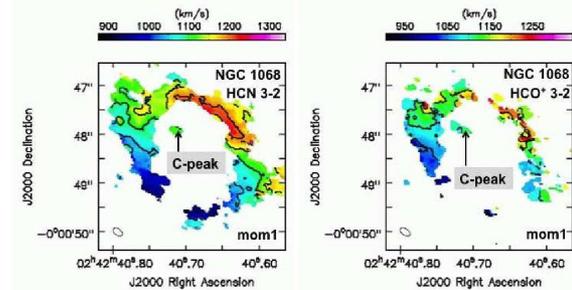

1. Spectral line emission from C+ in a normal galaxy like the Milky Way at a redshift of  $z=3$ , in less than 24 hours

2. Image the gas kinematics in protostars and in protoplanetary disks around young Sun-like stars in the nearest molecular clouds (150 pc)

3. Provide precise high dynamic range ( $=|\text{image max/image min}|$ ) images at an angular resolution of 0.1 arcsec

[More info in the ALMA Science Primer](#)

[from the latest ALMA press releases](#)

# Why ALMA is ALMA?

The science cases define the ALMA requirements in terms of:

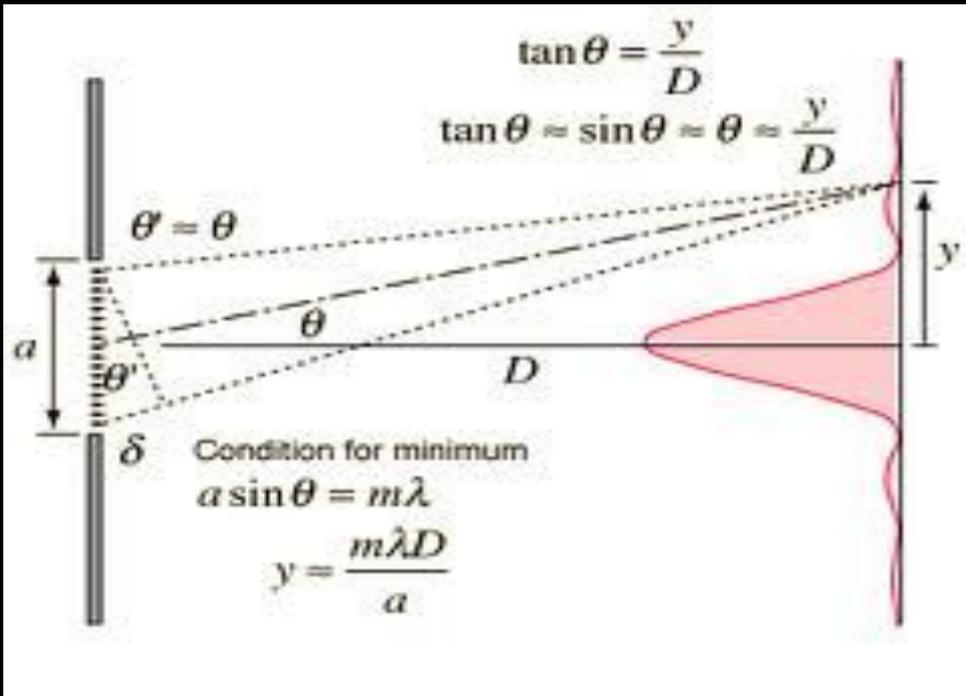

- high angular resolution
- observing frequencies
- high sensitivity
- mapping of different spatial scales
- high spectral resolution

ALMA is a flexible instrument

- reconfigurable interferometer
- observing at (sub)mm
- in the Atacama Desert (5000m)
- composite instrument
- peculiar spectral setups

# Why ALMA is an interferometer?

**Angular resolution** of diffraction-limited telescope is

$$\Theta \sim \lambda/D \text{ radians}$$

where  $D$  is the diameter of the telescope and  $\lambda$  is the wavelength of observations

For example, Hubble Space Telescope

- $\lambda \sim 1 \mu\text{m}$  and  $D$  of 2.4 m  $\rightarrow \Theta \sim 0.13$  arcsec

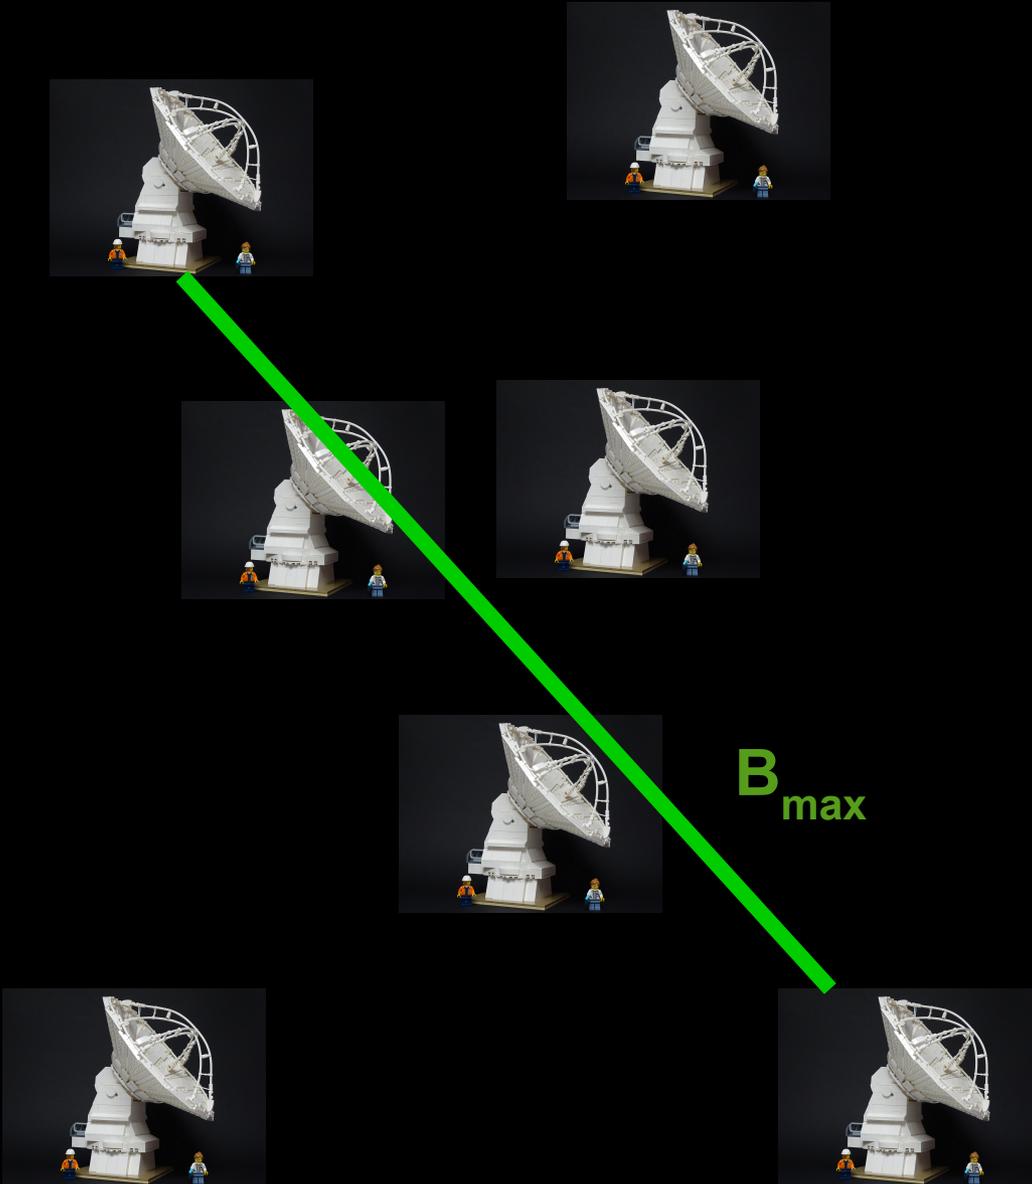

To reach that angular resolution for  $\lambda = 1$  mm observations

$\rightarrow$  it is necessary a 2 km-diameter dish

# Interferometry is needed

because of the limitations of building large single dish telescopes

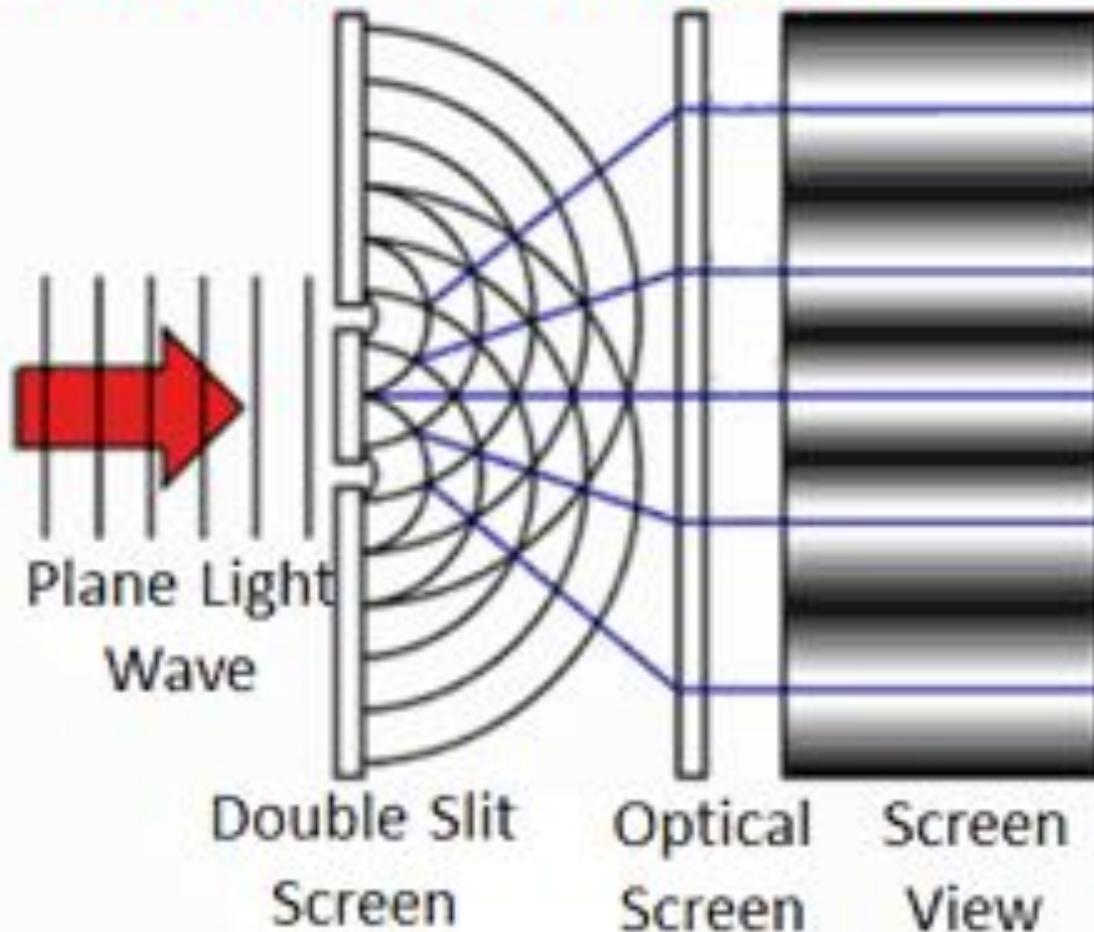

Basics:

- N antennas over a region
- $B$  is the baseline = distance between two antennas
- $\theta \sim \lambda / B_{max}$   
where  $B_{max}$  is the maximum distance between two antennas in the array
- $\theta$  is also referred as **Synthesized Beam**

# Interferometry: the basics

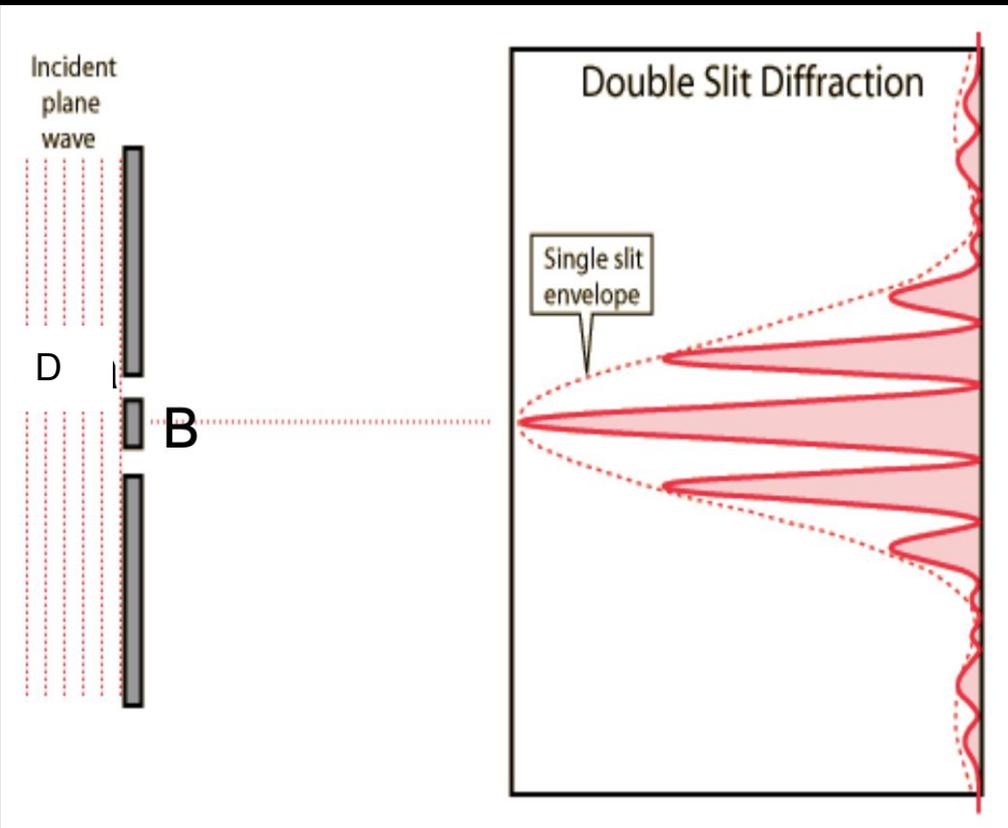

Pair of radio telescopes work like a **2-slit Young's experiment**

## Light Wave Interference Pattern

An interferometer of  $N$  antennas measures the **interference pattern** produced by  $N(N-1)/2$  **independent** pairs of apertures

# Diffraction pattern from an array

$FOV = \lambda/D$   
is  
**Field of View or Primary Beam.**

The response function of an interferometer is modulated in a region of FoV size

→ **ASA final images are primary beam corrected**

**!!! See Luke talk 'ALMA imaging basics' !!!**

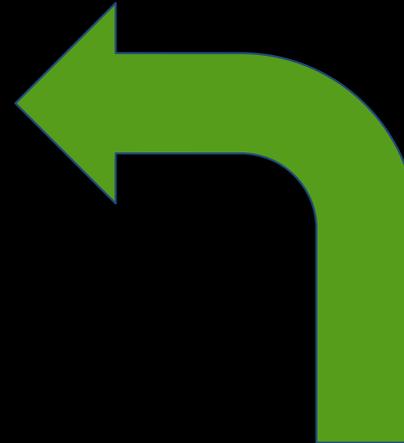

# What ALMA observes and produces?

!!! See George talk 'ALMA archive content'!!!

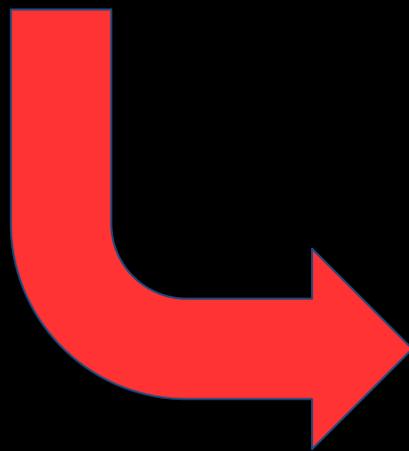

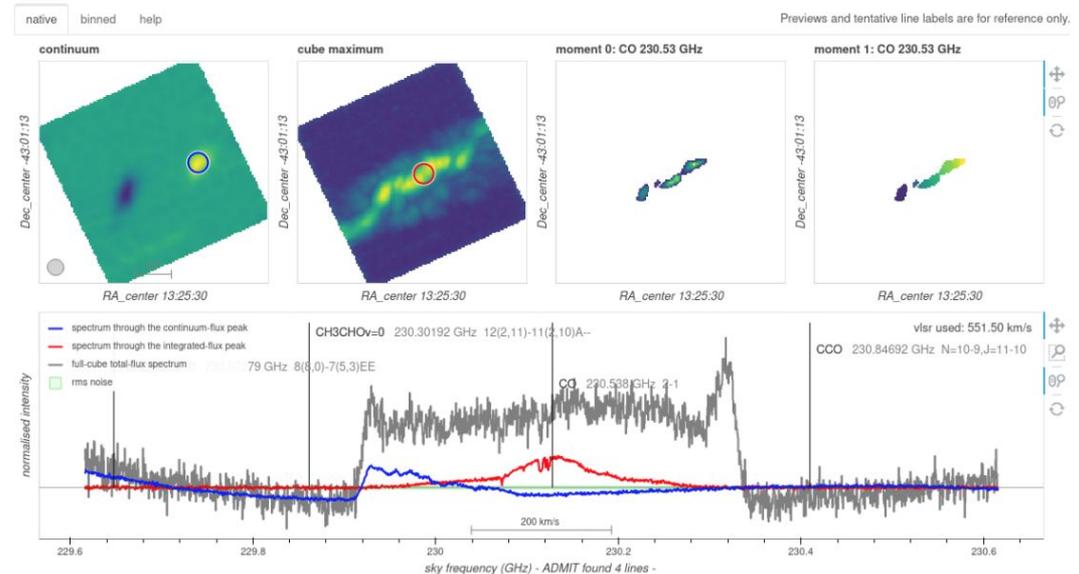

Table Browser interface showing a table of observation parameters for 'small\_avg.ms'. The table has columns: UVW, FLAG, AG\_CATEGOR, WEIGHT, SIGMA, ANTENNA1, ANTENNA2, ARRAY\_ID, DATA\_DESC\_I. The table contains 13 rows of data.

Raw data (i.e. visibilities) are stored in TABLES

member.uid\_\_A001\_X1458\_X16c.NGC\_5128\_sci.spw17.cube.l.sd.fits

IMAGES are FITS files

# Visibility and Sky Brightness

The **Fourier Theory (FT)** states that any well behaved signal (including imaging) can be expressed as **sum of sinusoids**.

(van Cittert-Zernike theorem)

Fourier space/domain

$$V(u, v) = \iint T(x, y) e^{2\pi i(ux+vy)} dx dy$$

$$T(x, y) = \iint V(u, v) e^{-2\pi i(ux+vy)} du dv$$

Image space/domain

For small fields of view, the **complex visibility  $V(u,v)$  is the 2D Fourier Transform of the brightness on the sky ( $T(x,y)$ )**

# Brightness temperature vs Flux density

Rayleigh-Jeans law:

$$S = \frac{2 k T \Omega_S}{\lambda^2}$$

Flux density S in Jy

$$\Omega_S = \frac{\pi \theta_b^2}{4 \ln 2}$$

- k Boltzmann constant
- $\Omega_S$  solid angle (steradian)
- $\theta_b$  HPBW of a gaussian

$$1 \text{ Jy} = 10^{-26} \text{ W m}^{-2} \text{ Hz}^{-1} = 10^{-23} \text{ erg s}^{-1} \text{ cm}^{-2} \text{ Hz}^{-1}$$

$$T = \frac{\lambda^2 S}{2 k \Omega_S}$$

Temperature T in Kelvin

Interferometric maps are measured in brightness unit I in Jy/beam

$$I = S/\text{beam}$$

$$T = 1.36 \frac{\lambda^2}{\theta_{maj} \theta_{min}} I$$

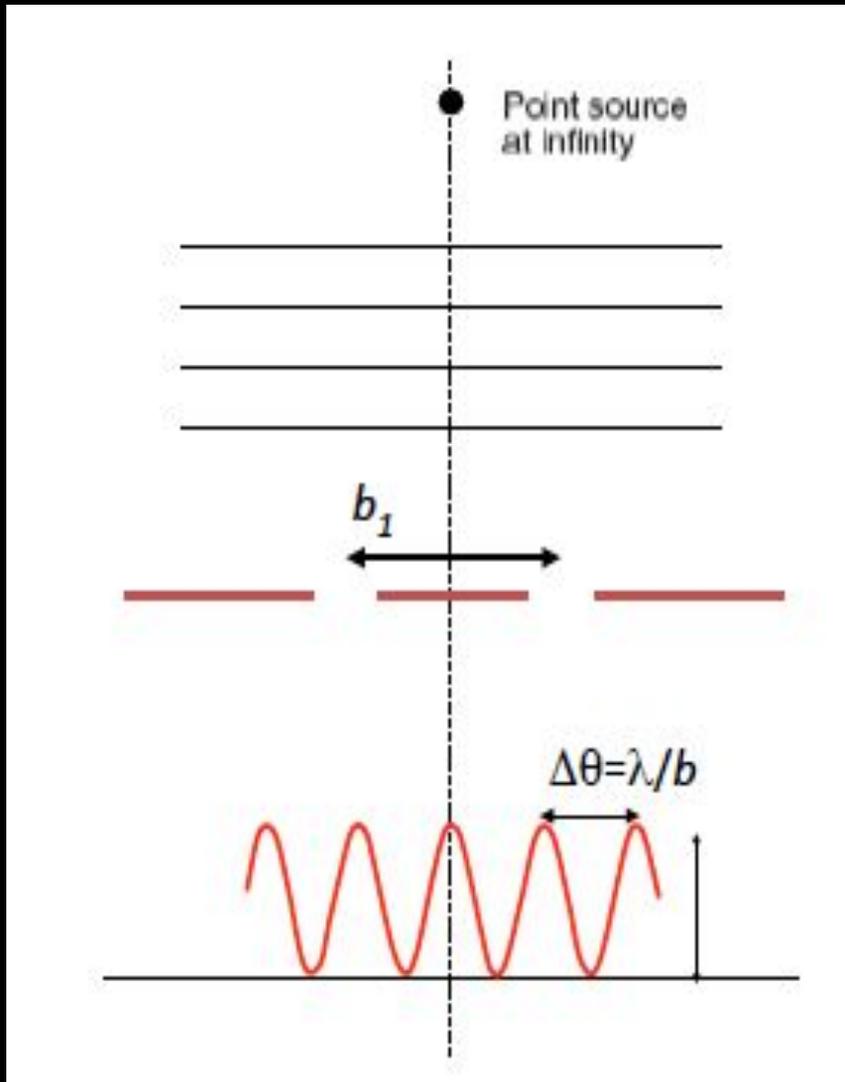

cm

mJy/beam

arcsec

[See also ALMA primer series on 'Estimating ALMA Sensitivity Using Single Dish Data'](#)

# The visibility properties

## Visibility (V)

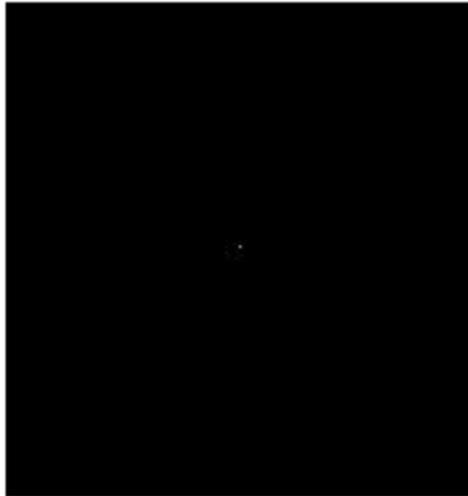

$$|V| = \frac{I_{\max} - I_{\min}}{I_{\max} + I_{\min}} = \frac{\text{Fringe Amplitude}}{\text{Average Intensity}}$$

$V = A e^{-i\phi}$  where:

- $A$  is **amplitude** tells “how much” of a certain frequency component
- $\phi$  is the **phase** “where” the component is located

# Some 2D Fourier Transform Pairs

# The image and u,v planes

(van Cittert-Zernike theorem)

Fourier space/domain

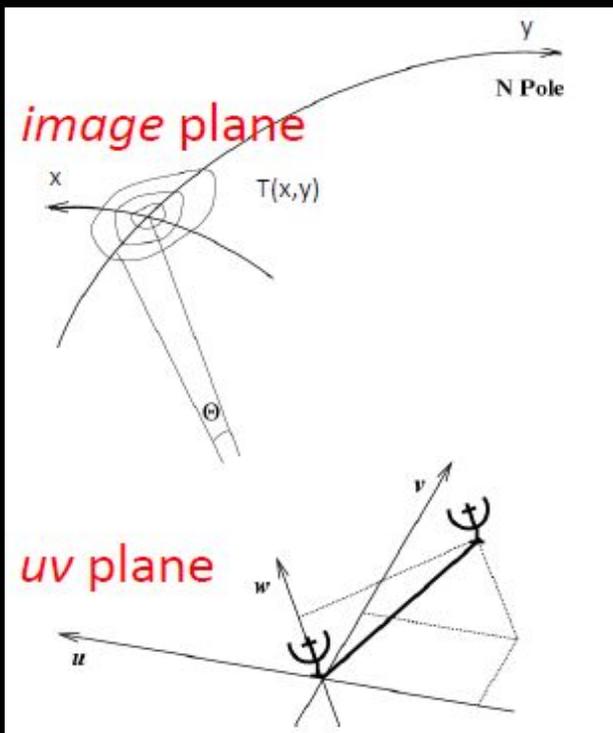

$$V(u, v) = \iint T(x, y) e^{2\pi i(ux+vy)} dx dy$$

$$T(x, y) = \iint V(u, v) e^{-2\pi i(ux+vy)} du dv$$

Image space/domain

- **u,v (wavelengths)** are spatial frequencies in E-W and N-S, i.e the E-W and N-S component of the **projected baselines**

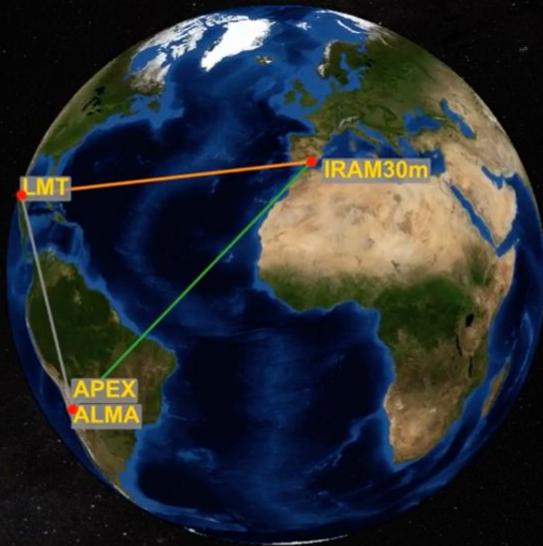

- **x,y (rad)** are **angles** in tangent plane related to a reference position in the E-W and N-S directions

**!!! The (u,v) coverage is crucial:  
it determines the image fidelity !!!**

# The image fidelity

EHT telescopes

$U$ - $V$  coverage

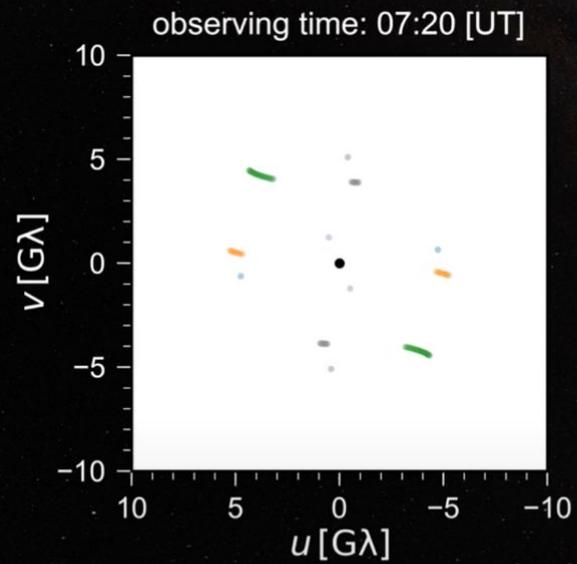

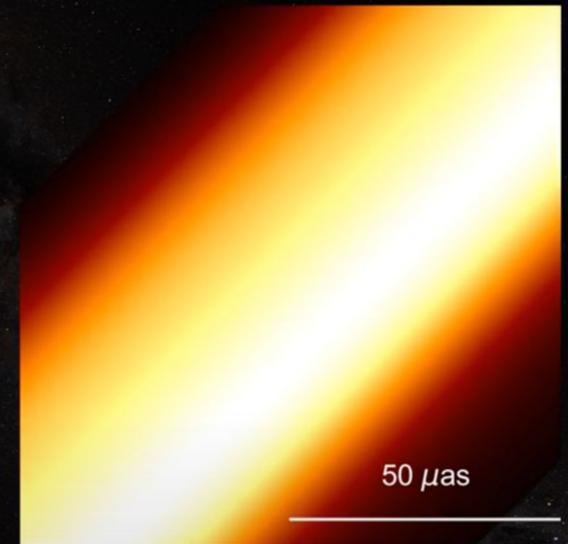

image reconstructed

# The image fidelity

EHT telescopes

$u$ - $v$  coverage

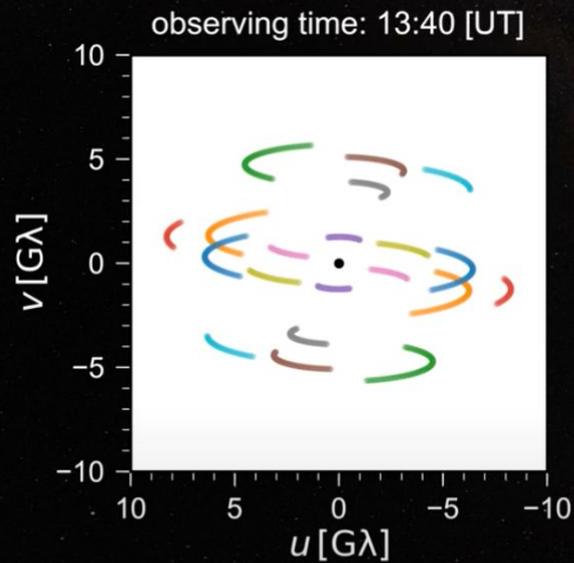

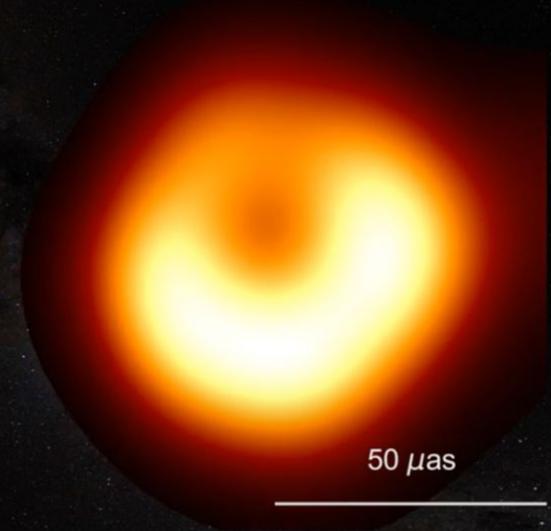

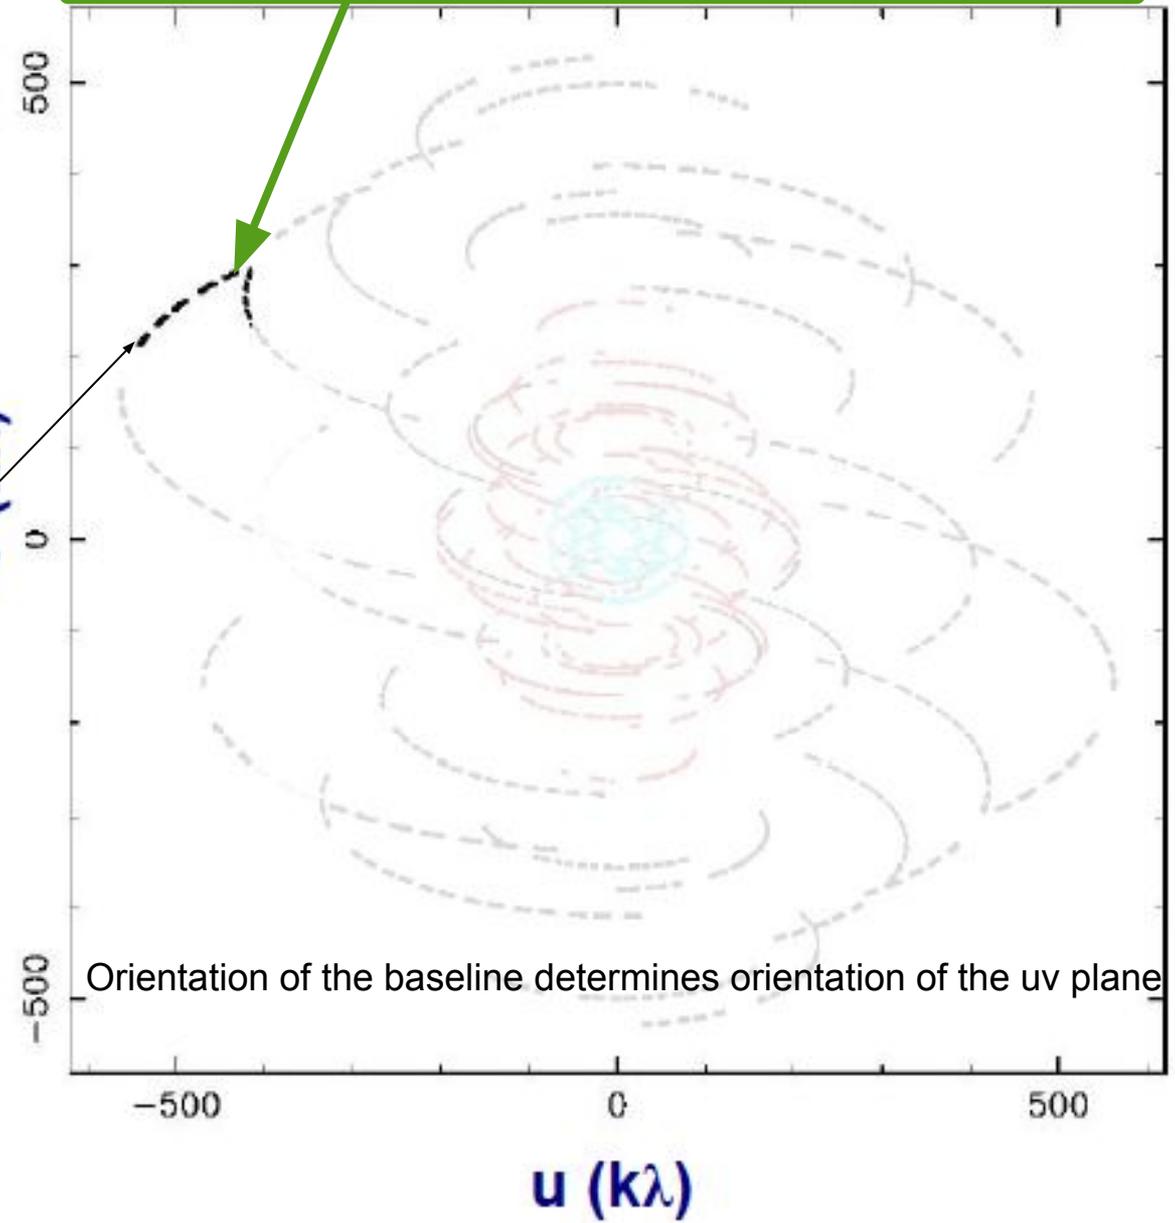

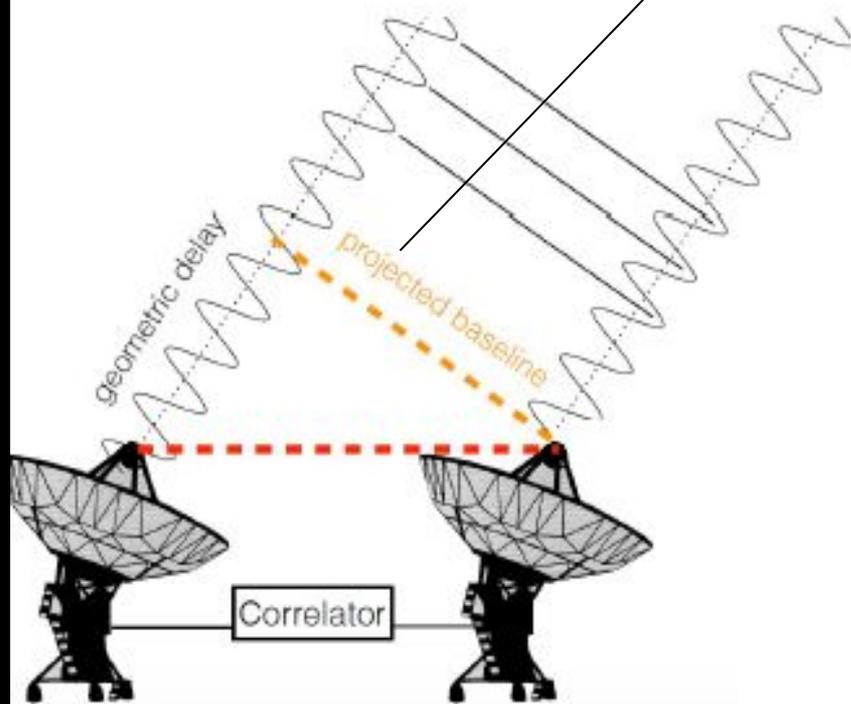

image reconstructed

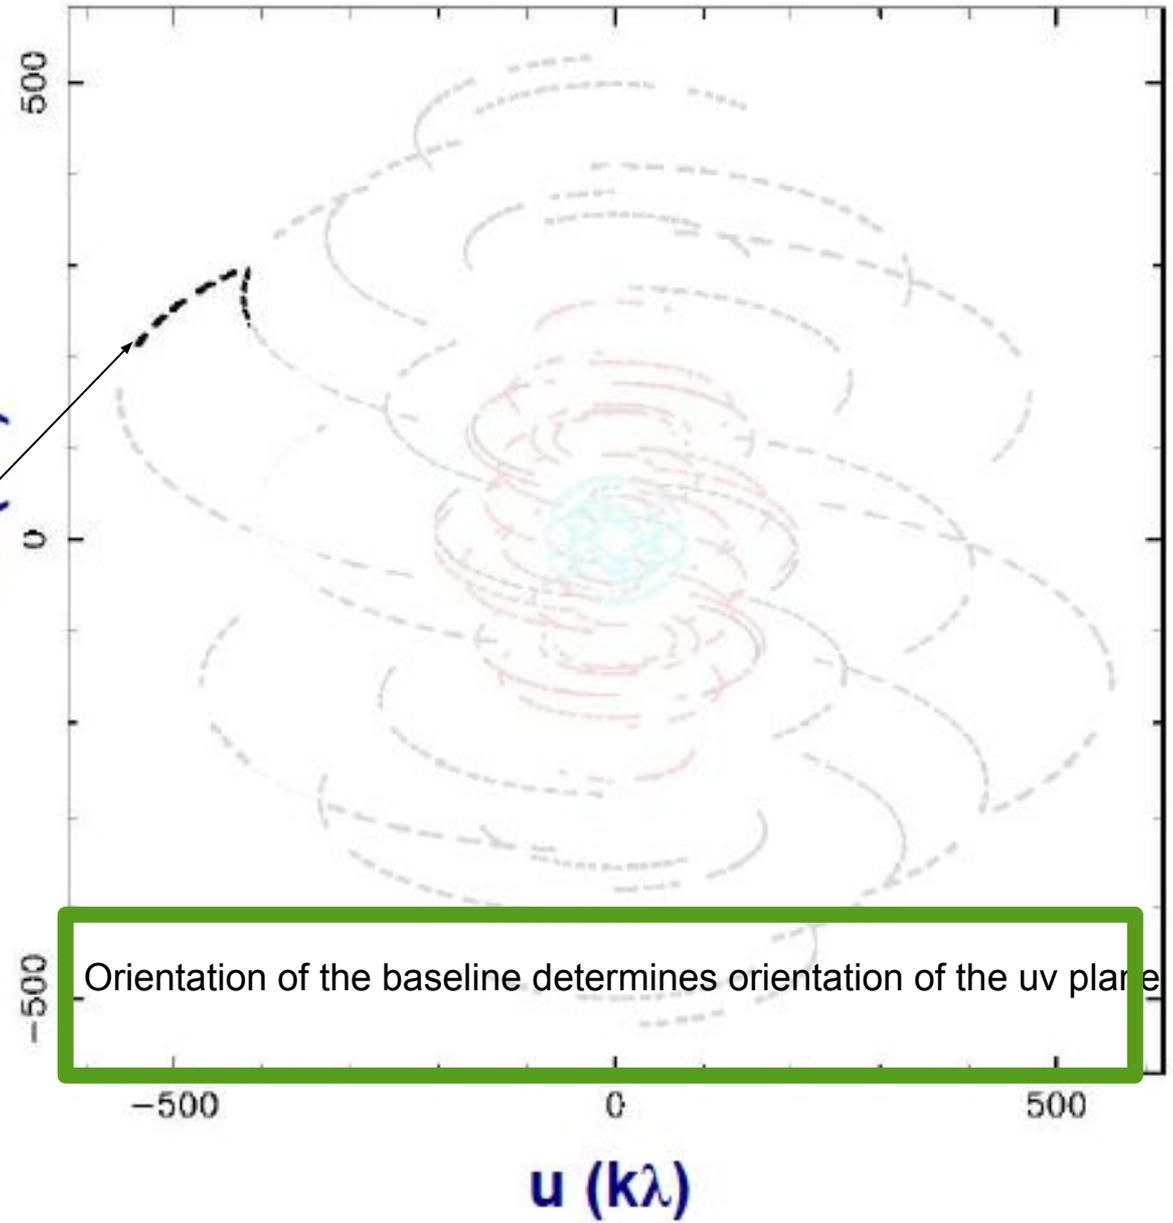

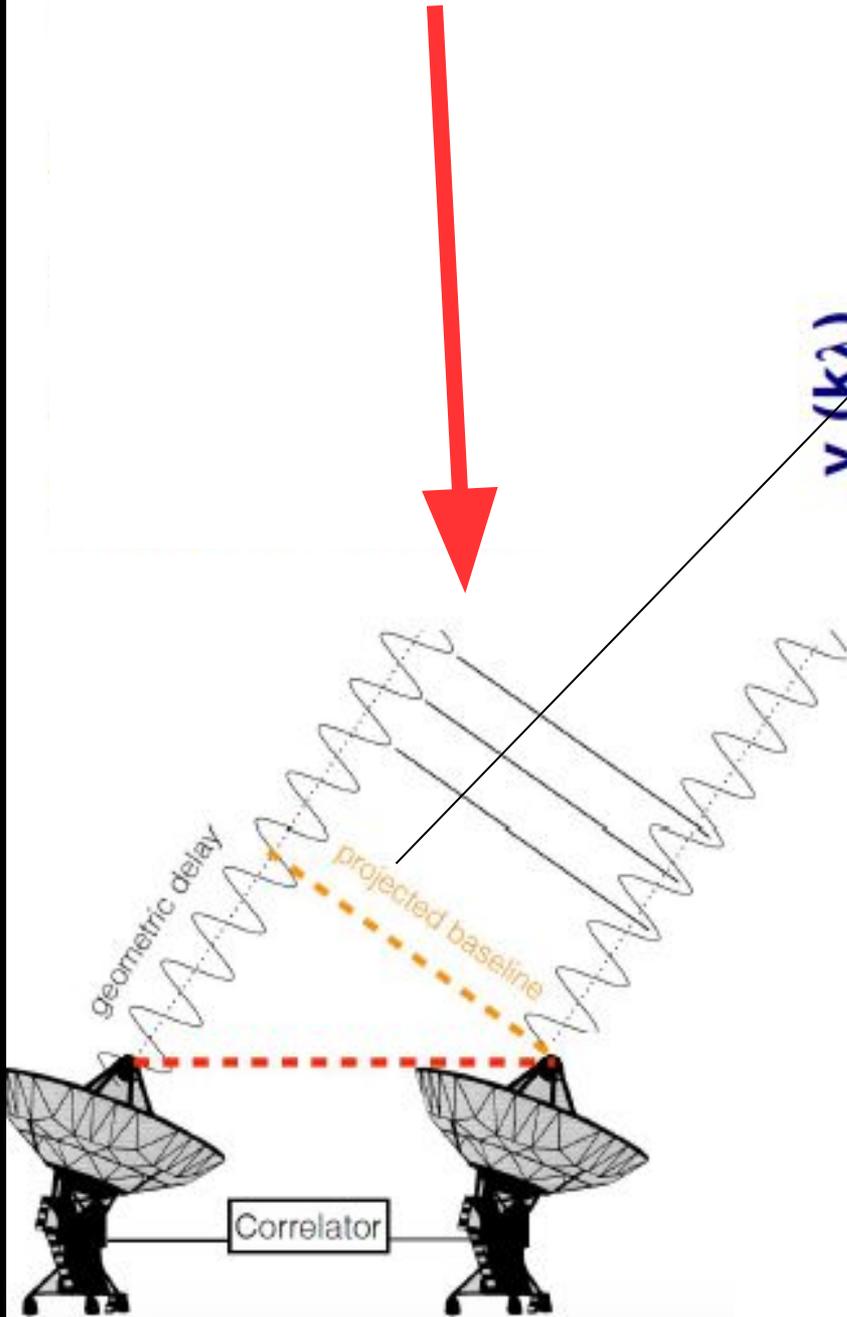

# Who populates the (u,v) plane?

Each antenna pair  $\rightarrow$  a point in the (u,v) plane

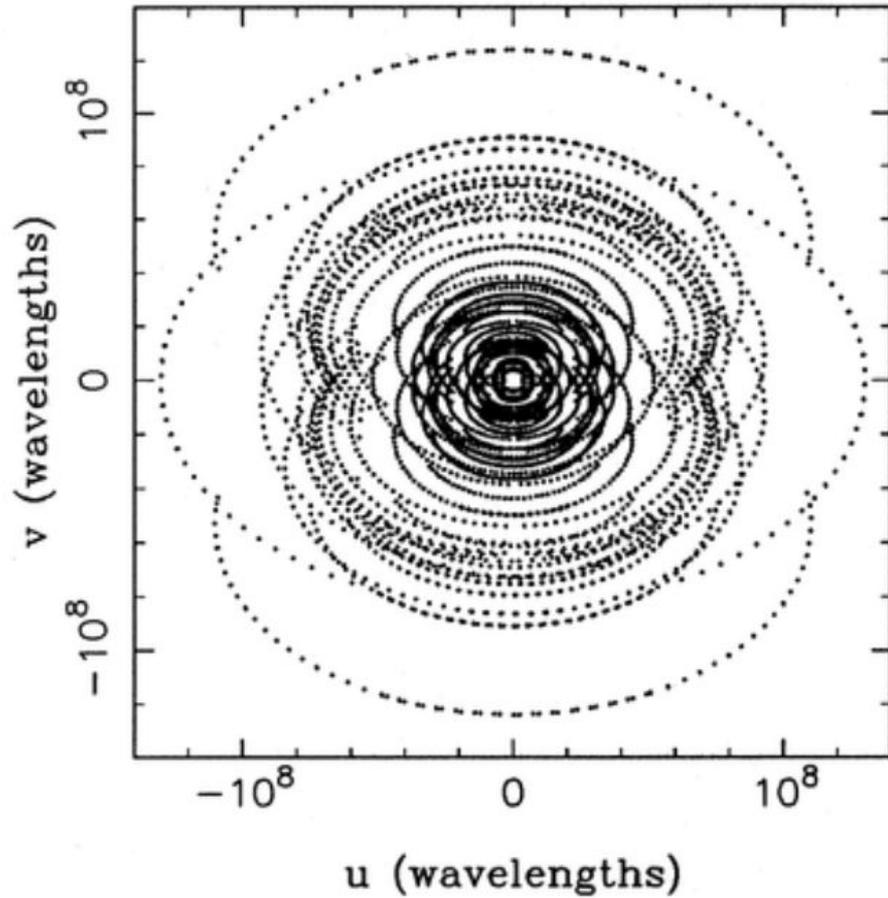

**NB: the projected baseline!!**

Each antenna pair  $\rightarrow$  a point in the  $(u,v)$  plane

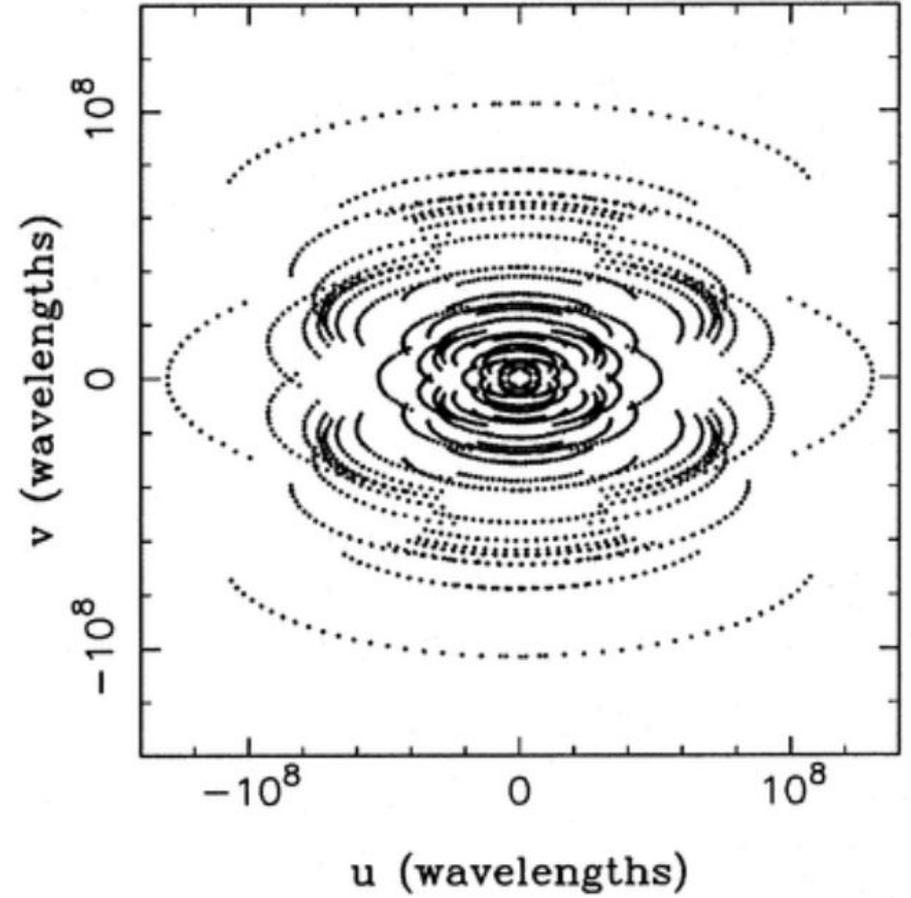

# The uv plane orientation depends on the source position

Dec 40

Dec 20

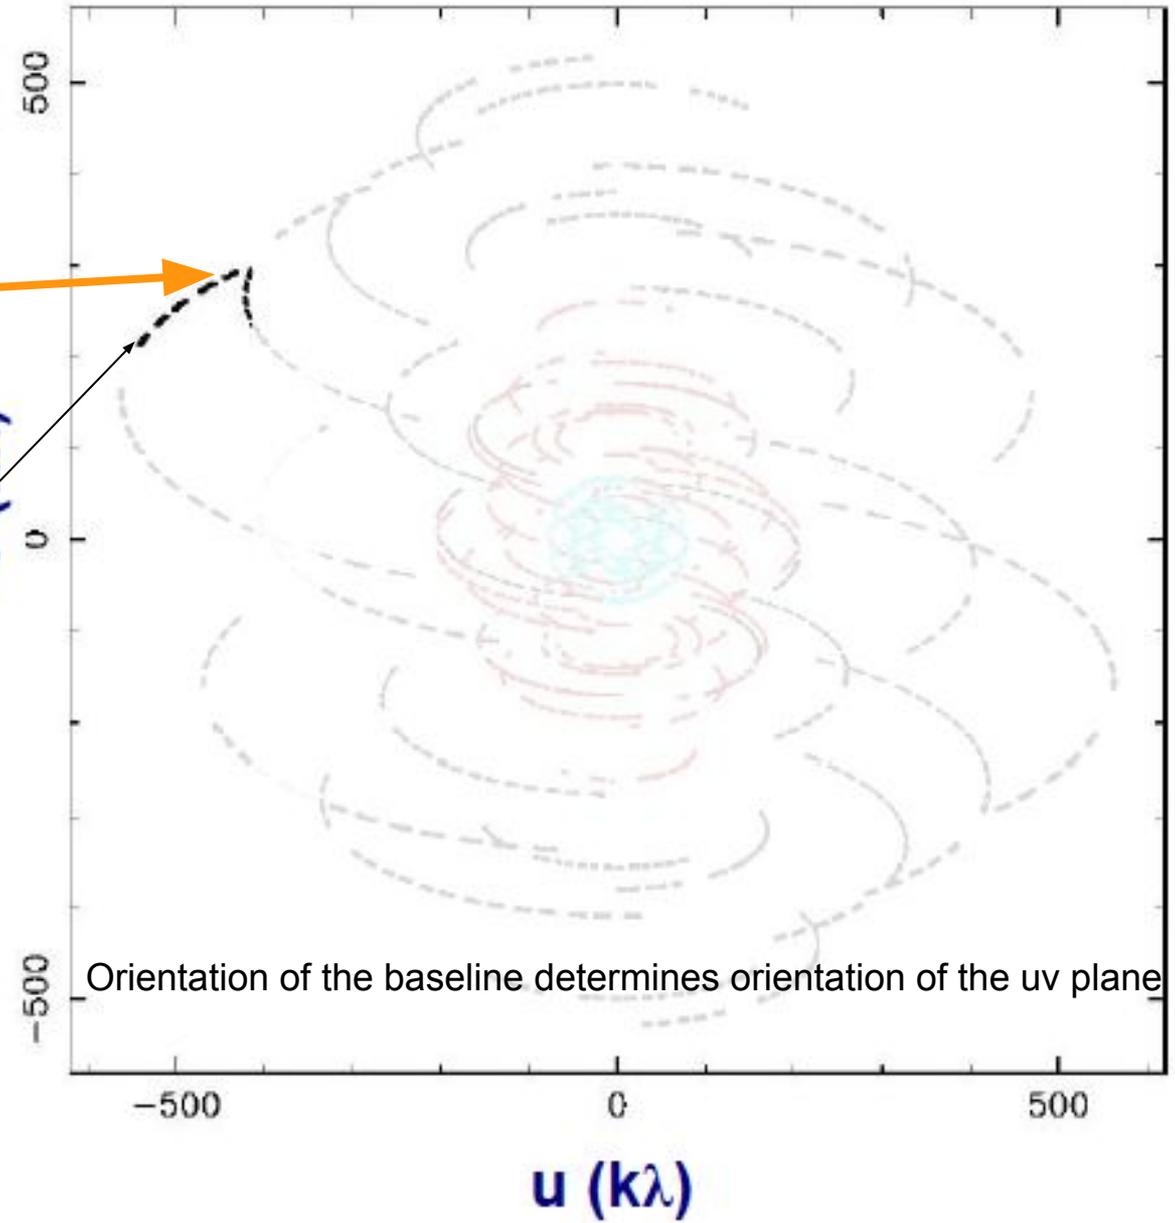

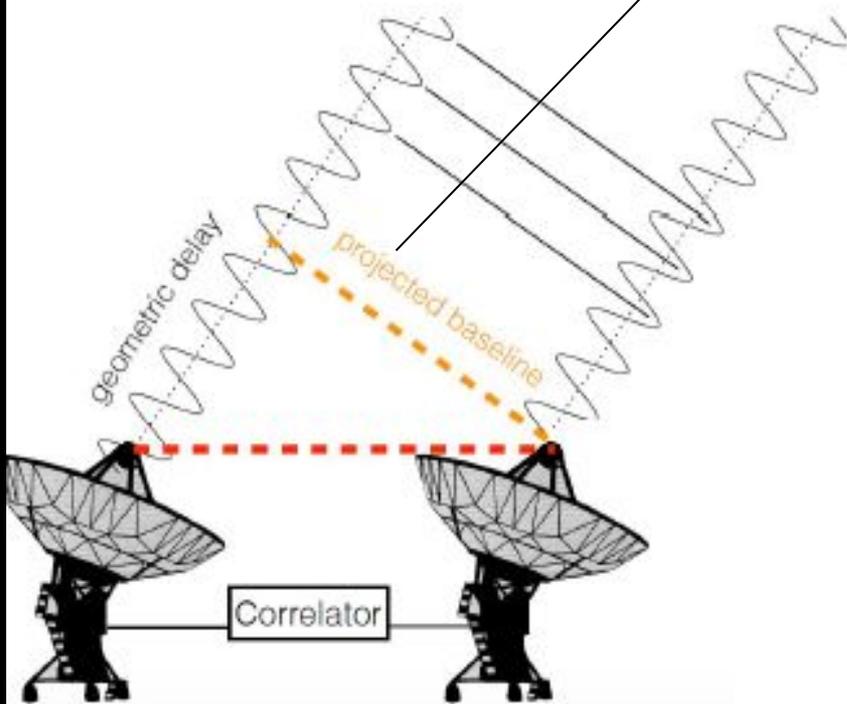

# How many (u,v) points?

Each antenna pair  $\rightarrow$  a point in the (u,v) plane

1 V for each:

- integration time,
- channel,
- projected baseline,
- correlation

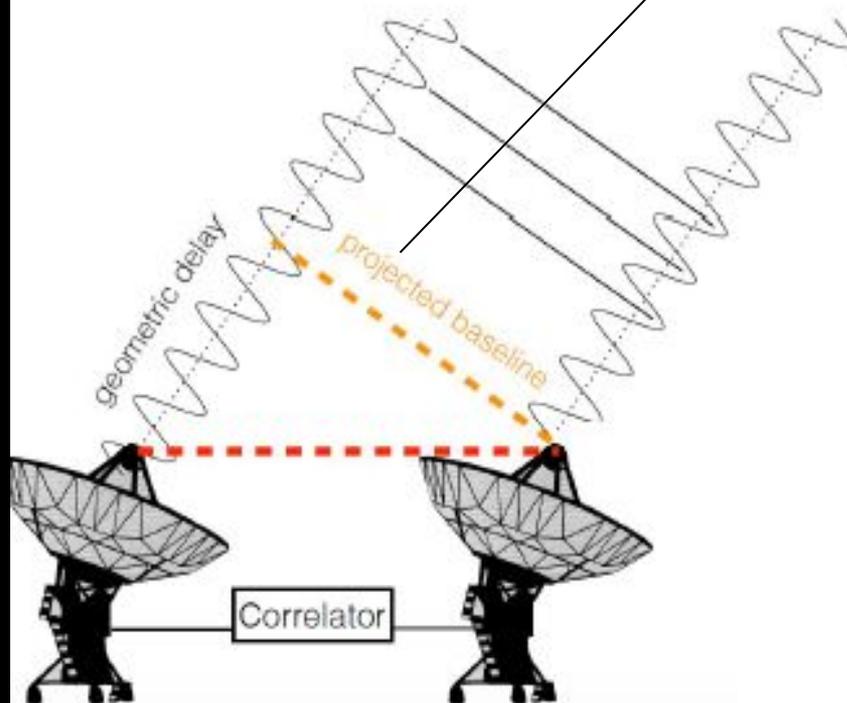

Orientation of the baseline determines orientation of the uv plane

# Where are they stored?

Each antenna pair → a point in the (u,v) plane

1 V for each:

- integration time,
- channel,
- projected baseline,
- correlation

!!! see Marcella talk on 'Advanced tips and tricks with ALMA archival data !!!

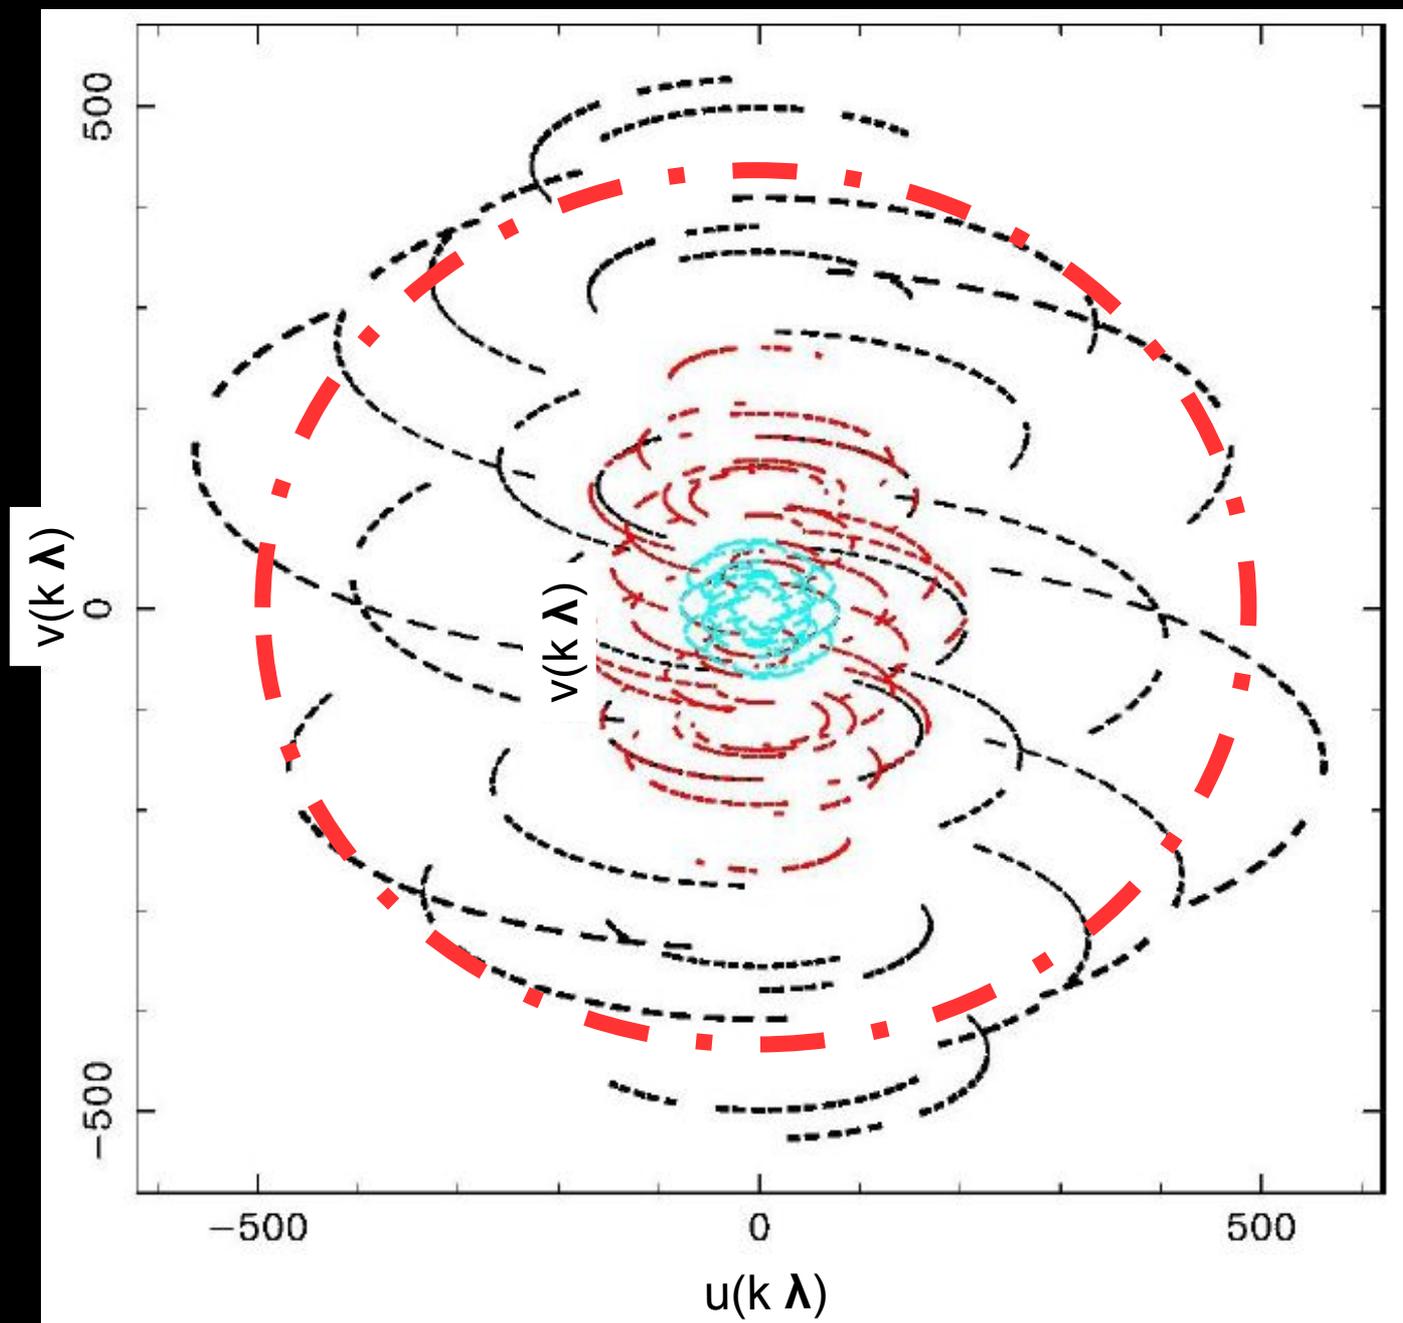

# Highest angular resolution

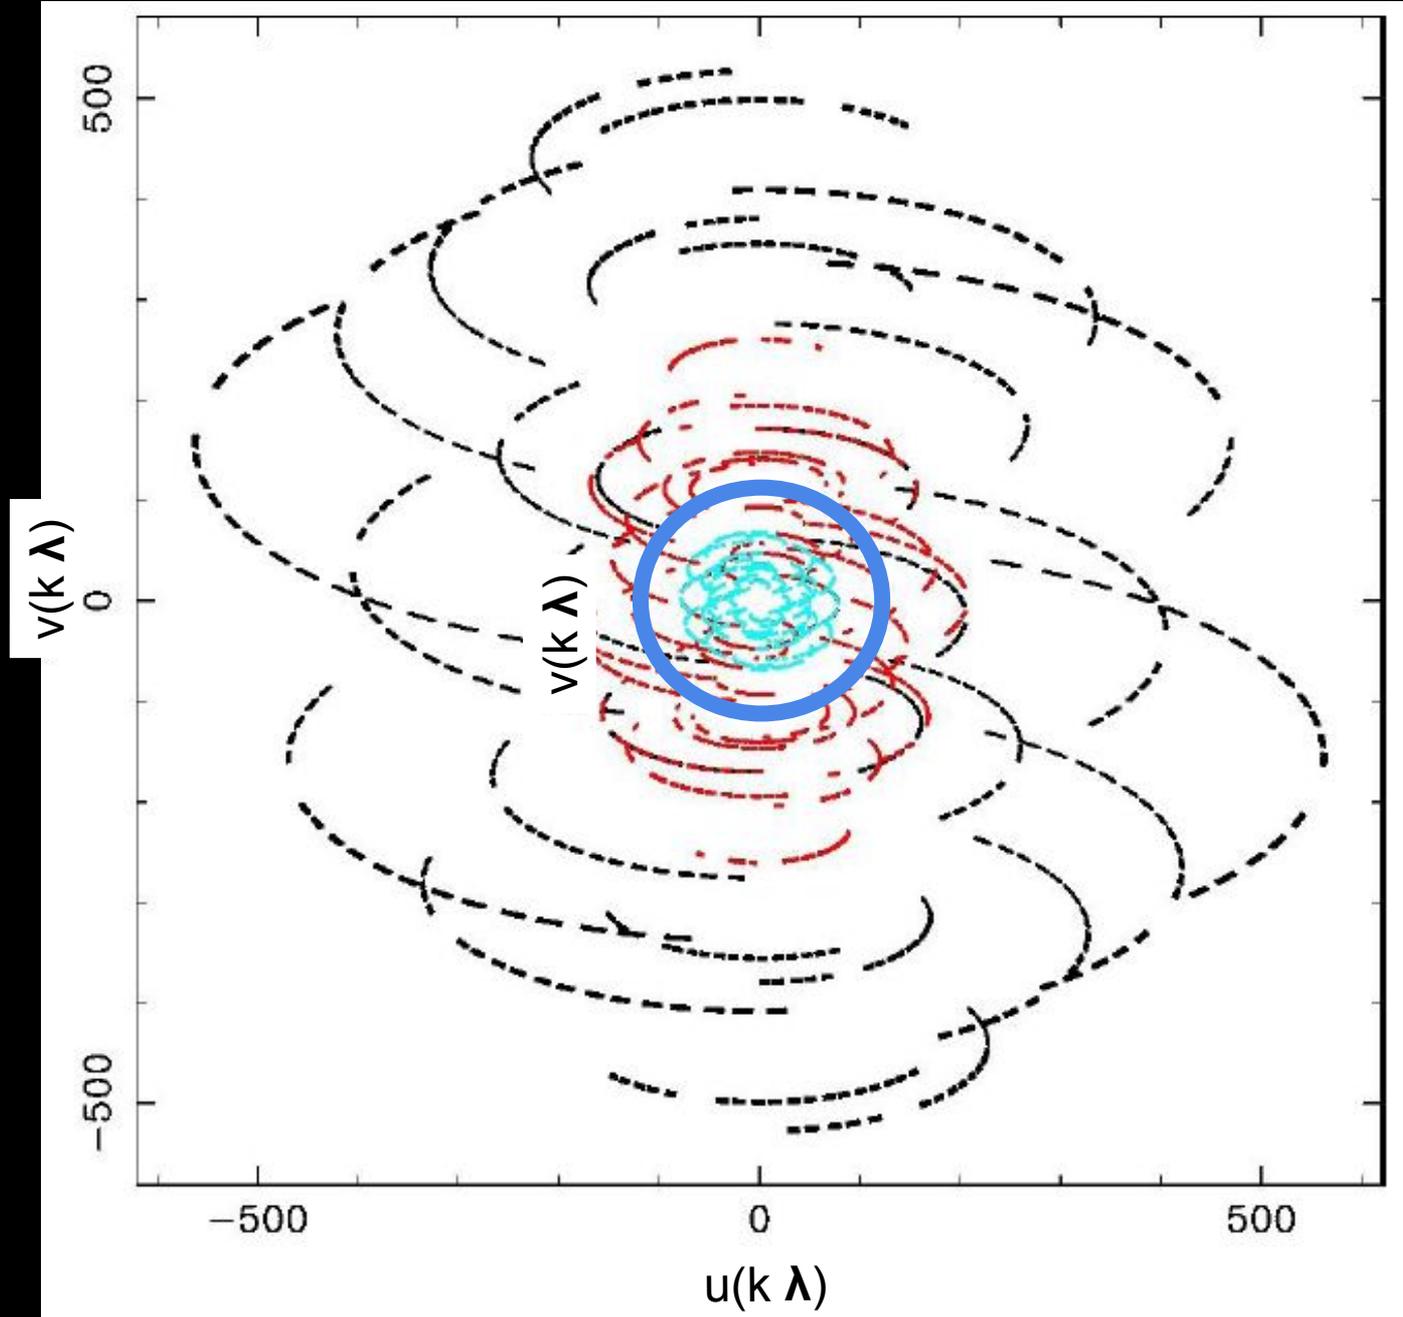

$\Theta_{\text{res}} \sim \lambda / B_{\text{max}}$   
where  $B_{\text{max}}$  is the  
maximum baseline  
(uv distance)

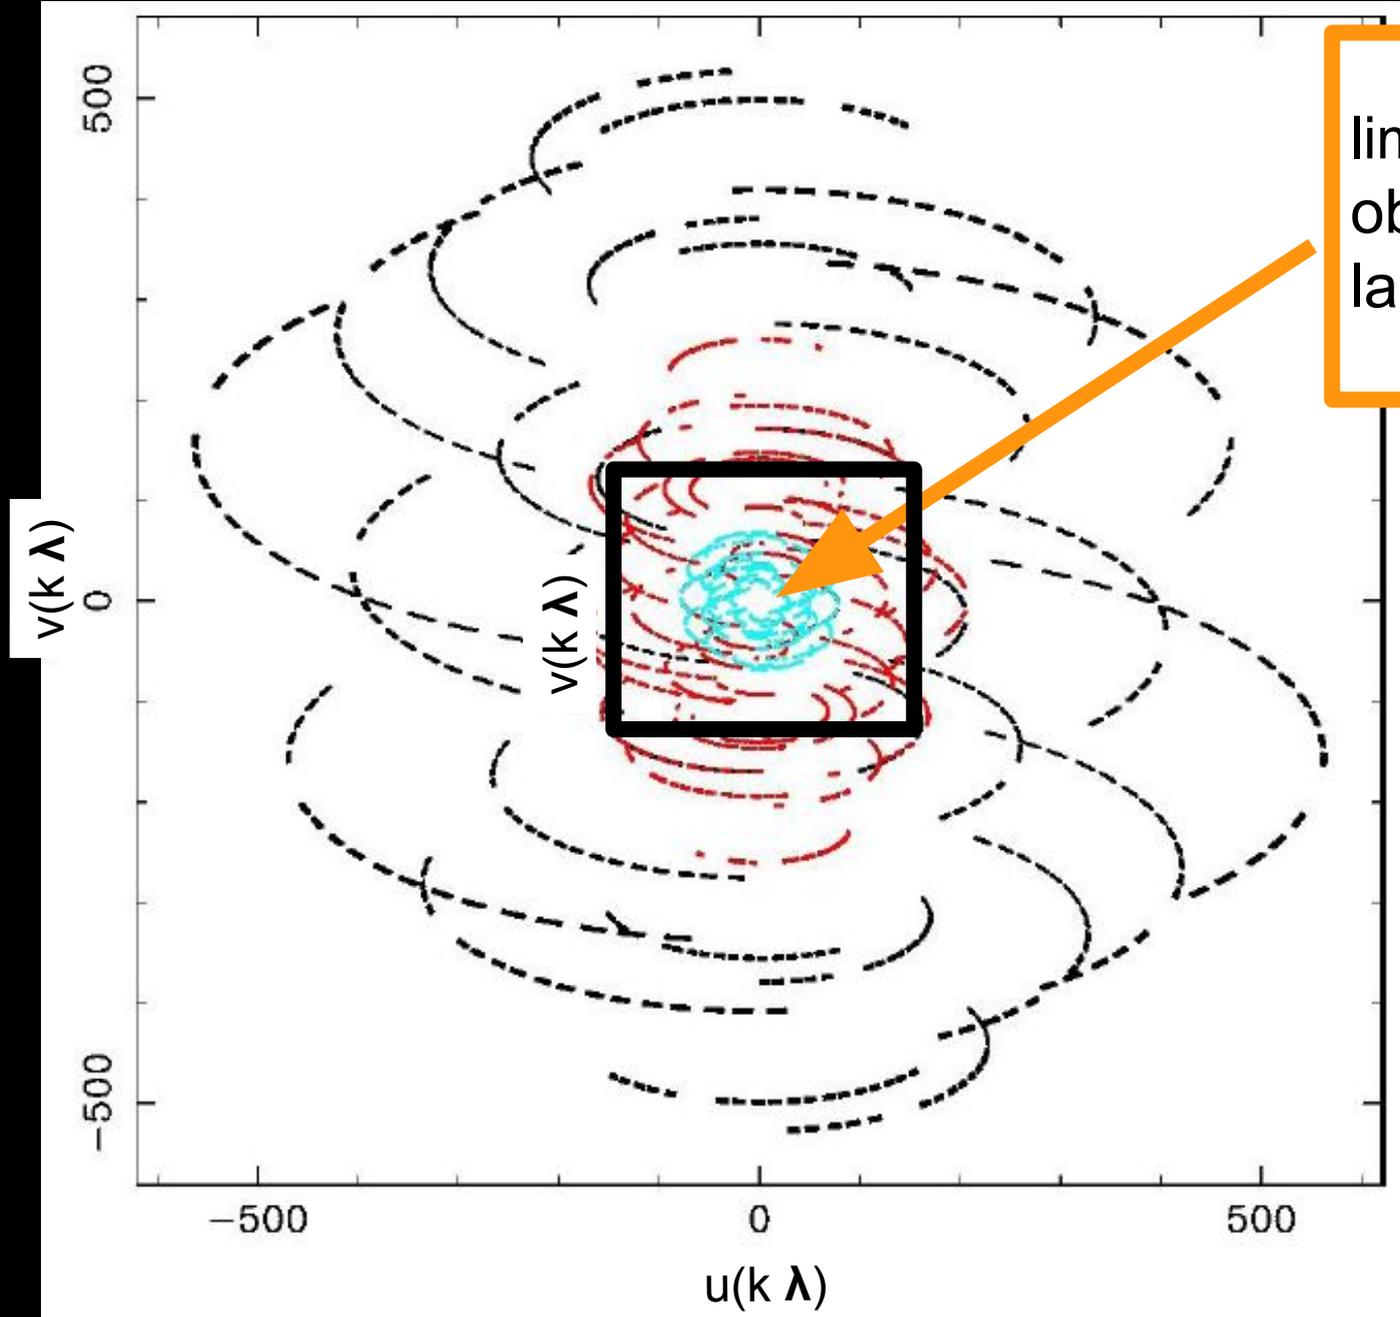

**Long (u,v) distance  $\rightarrow$  compact emission**

Small  $(u,v)$  distance  $\rightarrow$  extended emission

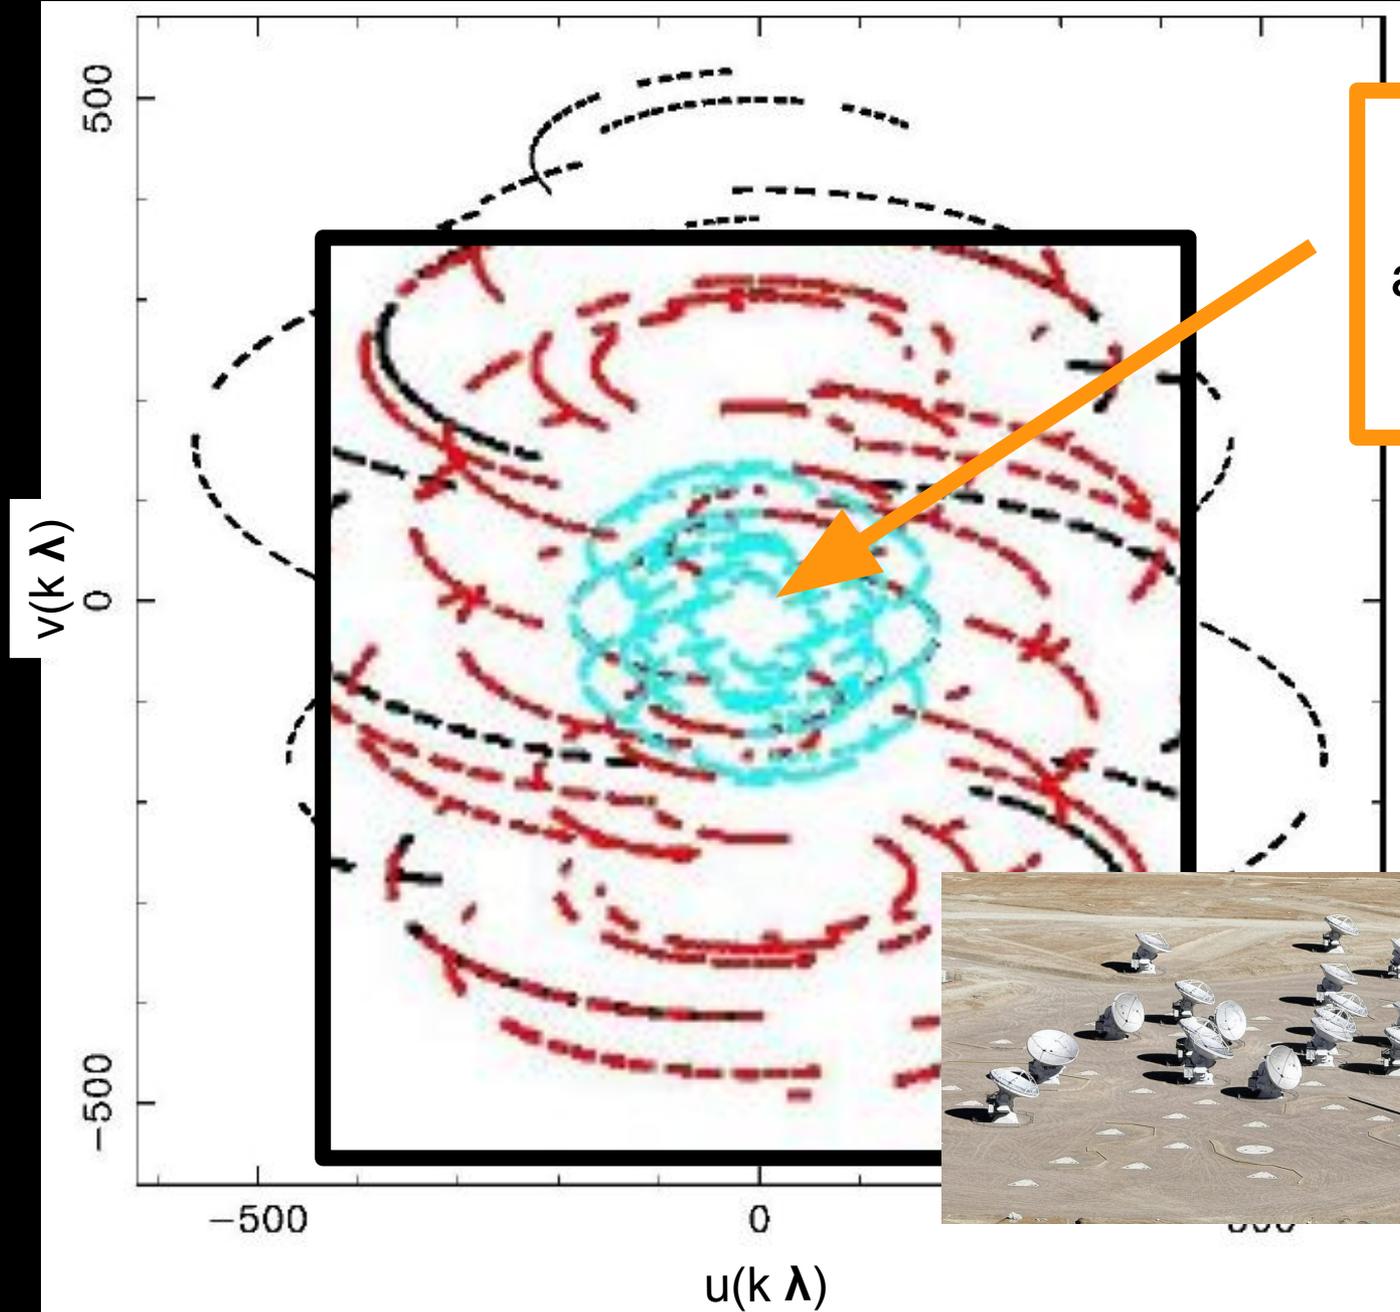

# No zero spacing $\rightarrow$ missing flux

limit on  
observable  
largest scale

# Why the missing zero spacing

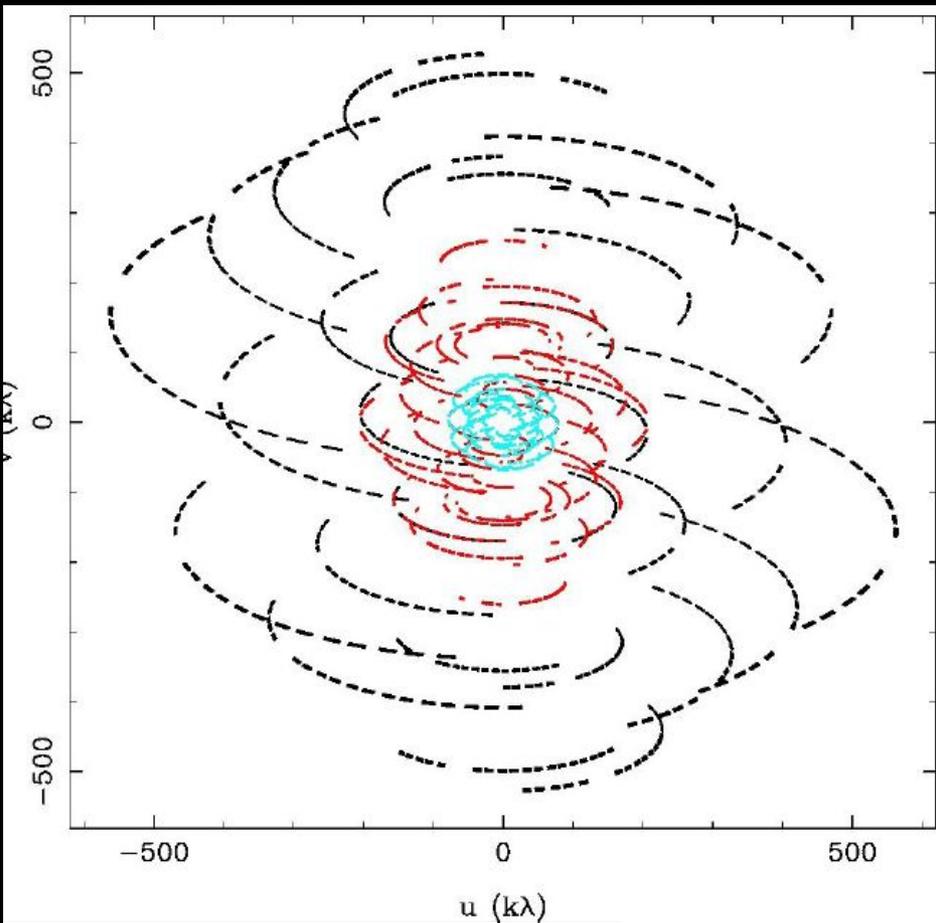

The distance between two antennas could not be zero!!

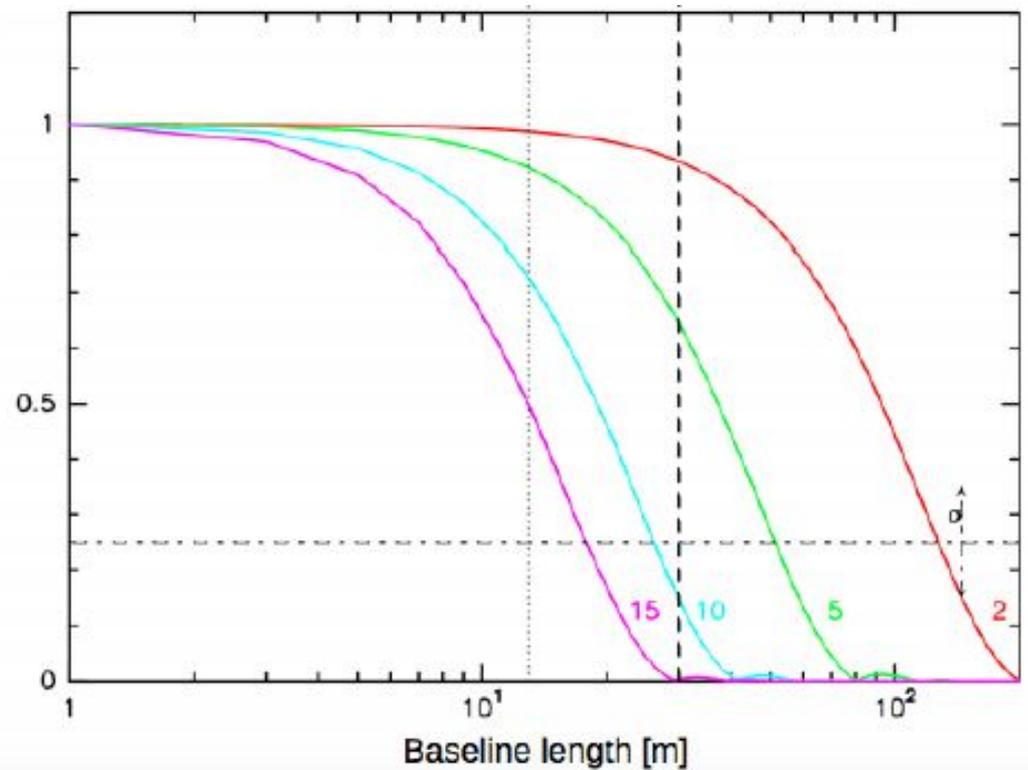

# (u,v) sampling vs Maximum recoverable scale (MRS)

$$\Theta_{\text{MRS}} \sim \lambda / B_{\text{min}}$$

Zero spacing is missing in interferometry  
→ Filtering of large scale emission

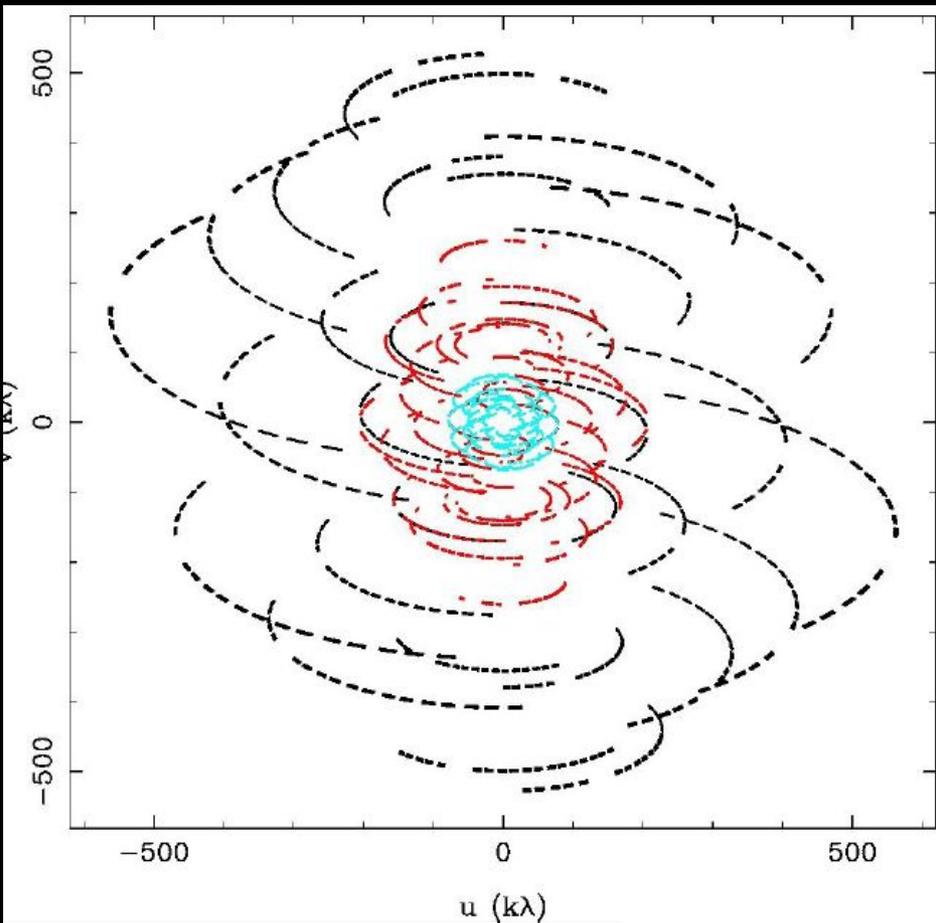

## Gaussian sources

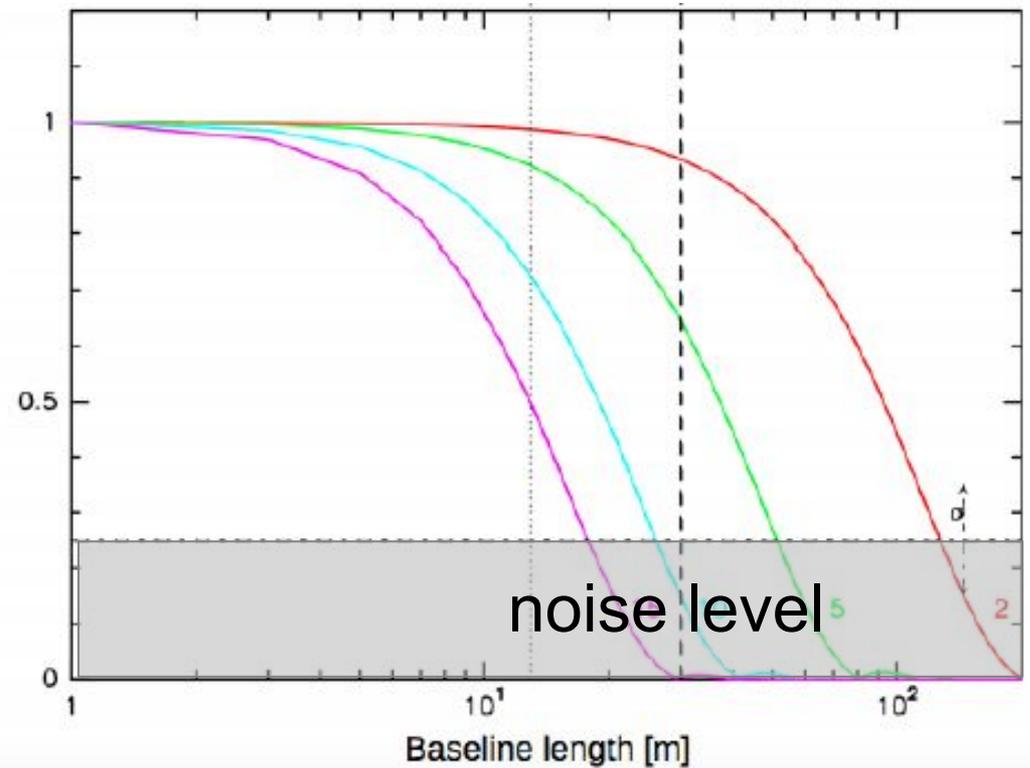

# (u,v) sampling vs Maximum recoverable scale (MRS)

$$\Theta_{\text{MRS}} \sim \lambda / B_{\text{min}}$$

Zero spacing is missing in interferometry  
→ Filtering of large scale emission

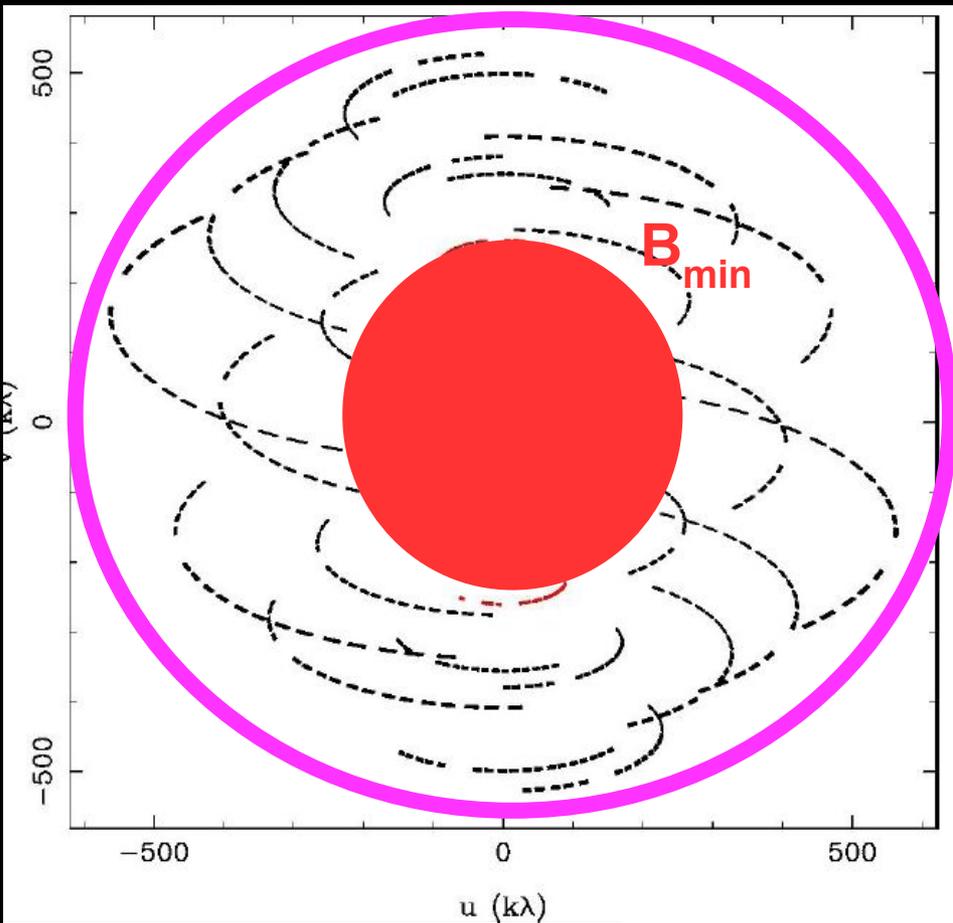

## Gaussian sources

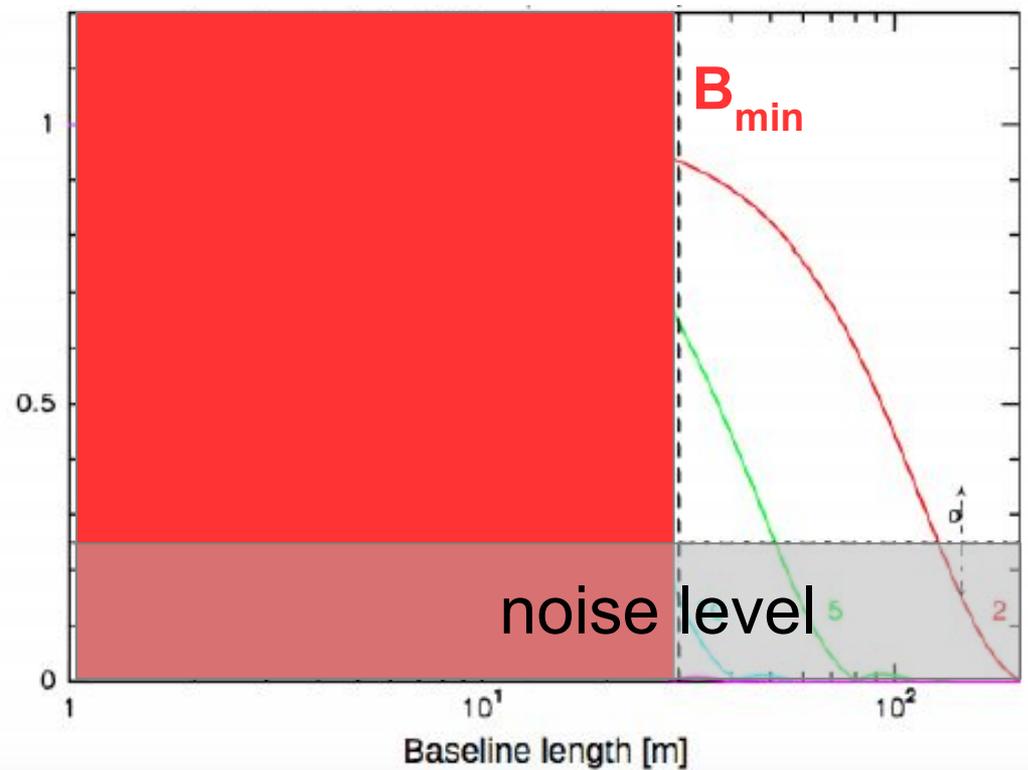

# (u,v) sampling vs Maximum recoverable scale (MRS)

$$\Theta_{\text{MRS}} \sim \lambda / B_{\text{min}}$$

The filtered large scale emission depends to  $B_{\text{min}}$

## Gaussian sources

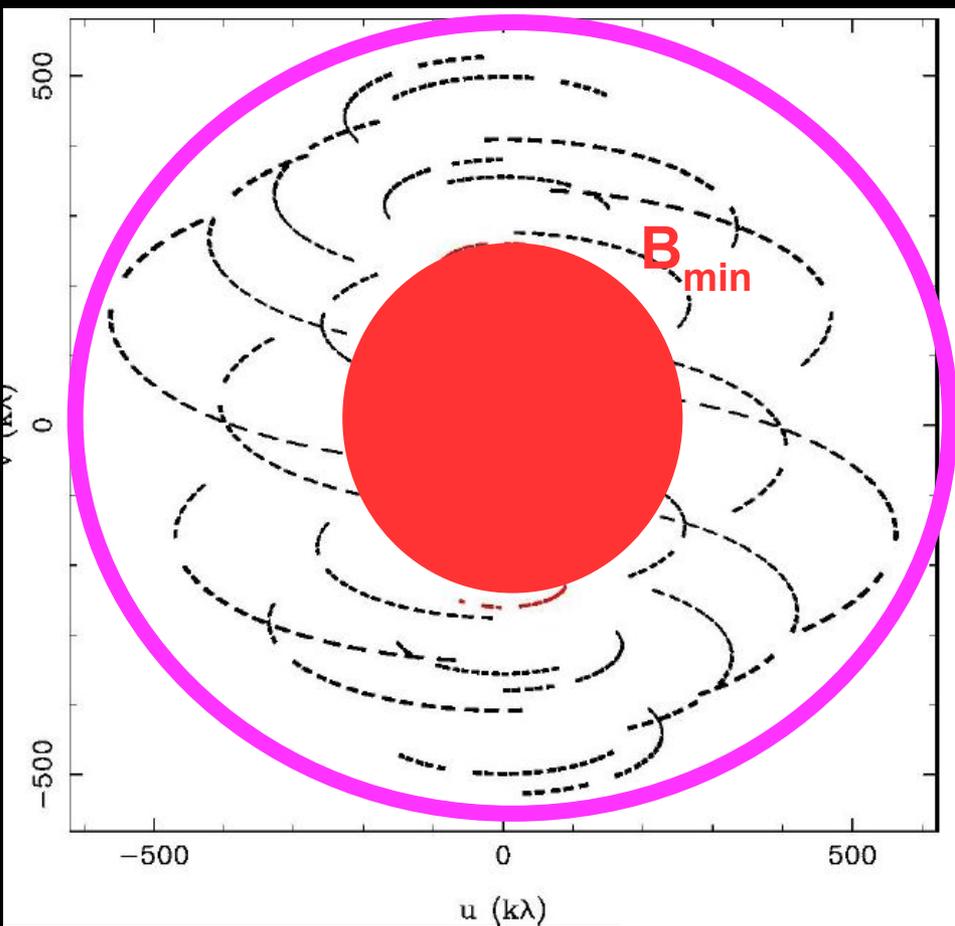

# (u,v) sampling vs Maximum recoverable scale (MRS)

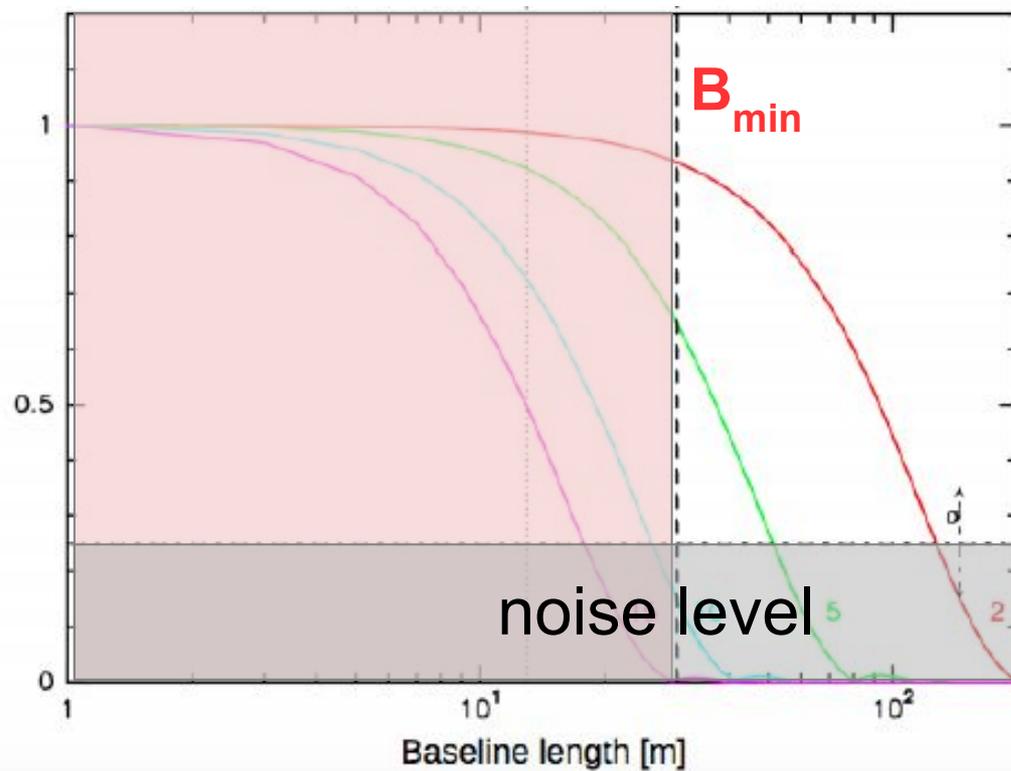

$$\Theta_{\text{MRS}} \sim \lambda / B_{\text{min}}$$

$B_{\text{min}}$

The filtered large scale emission depends to  $B_{\text{min}}$

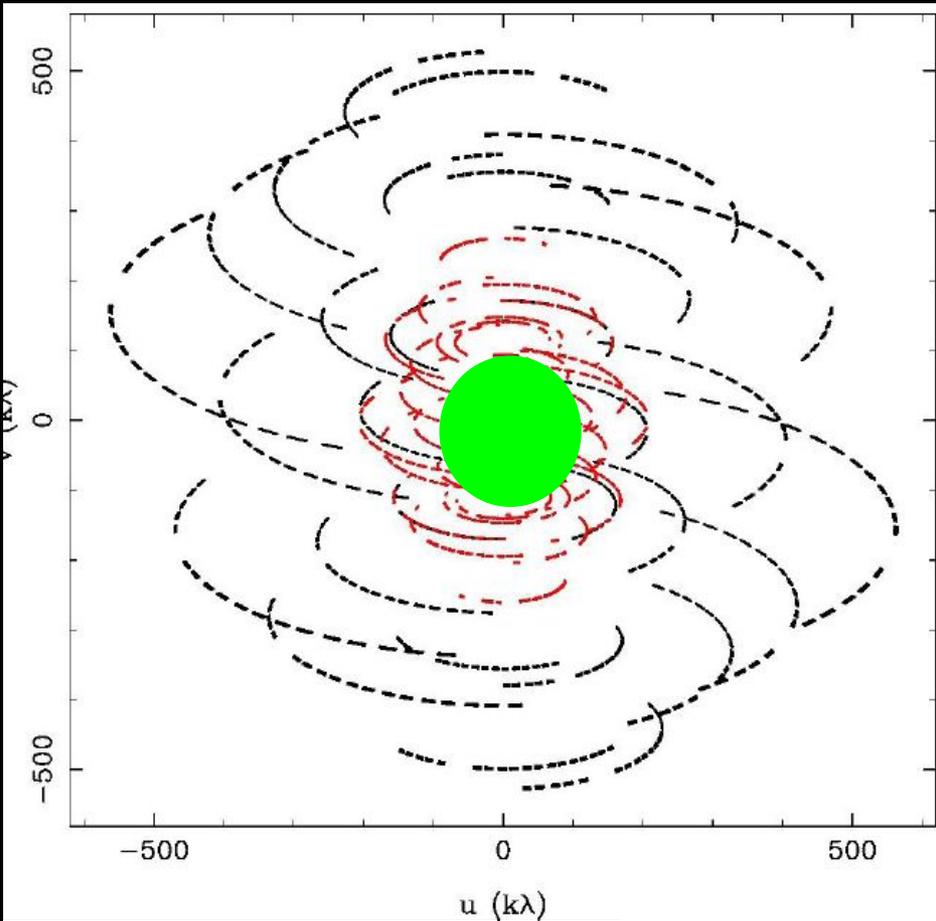

## Gaussian sources

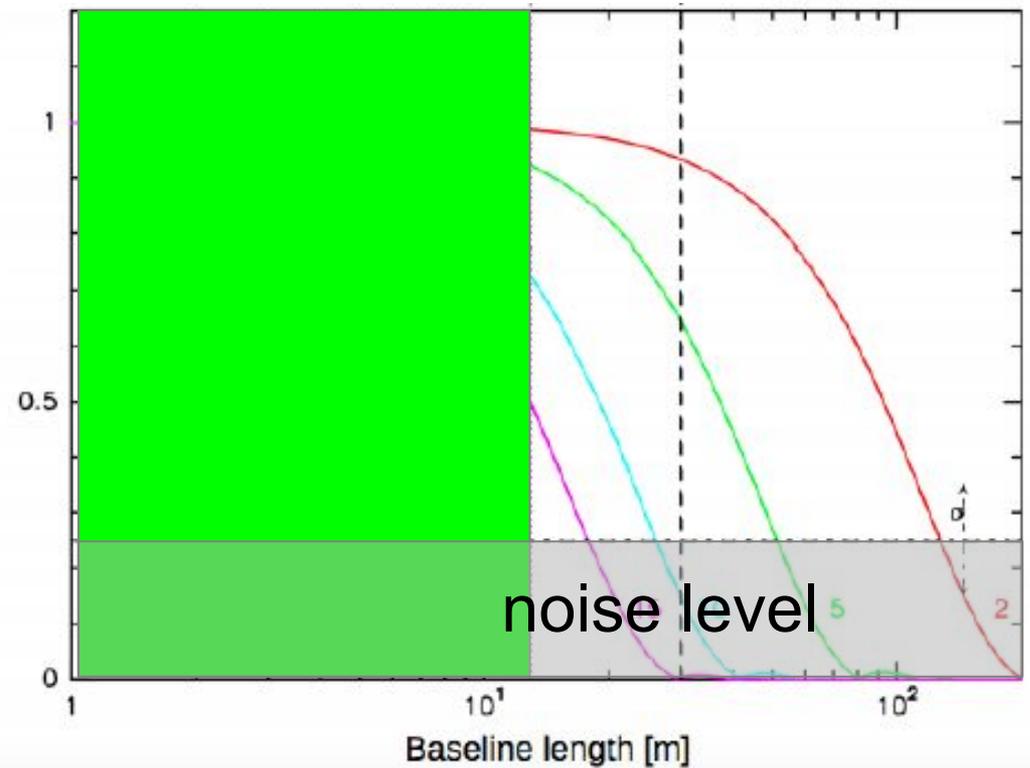

# (u,v) sampling vs Maximum recoverable scale (MRS)

$$\Theta_{\text{MRS}} \sim \lambda / B_{\text{min}}$$

More compact is the array configuration, less is the filtered large scale emission

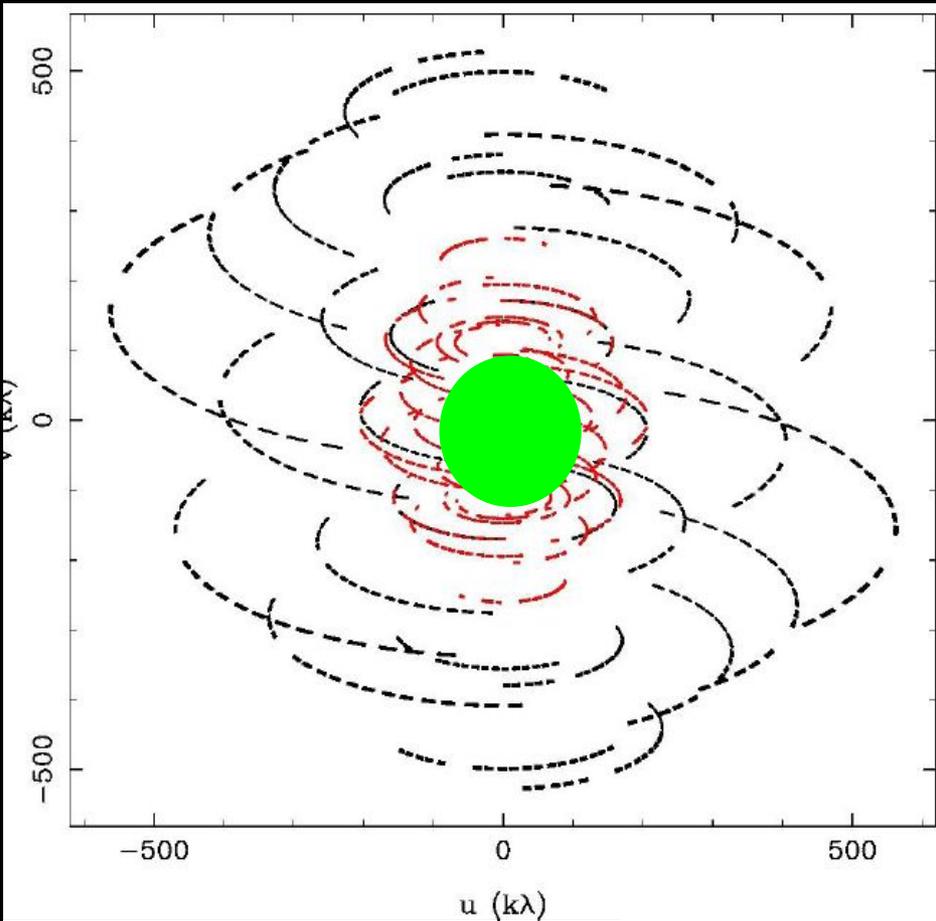

## Gaussian sources

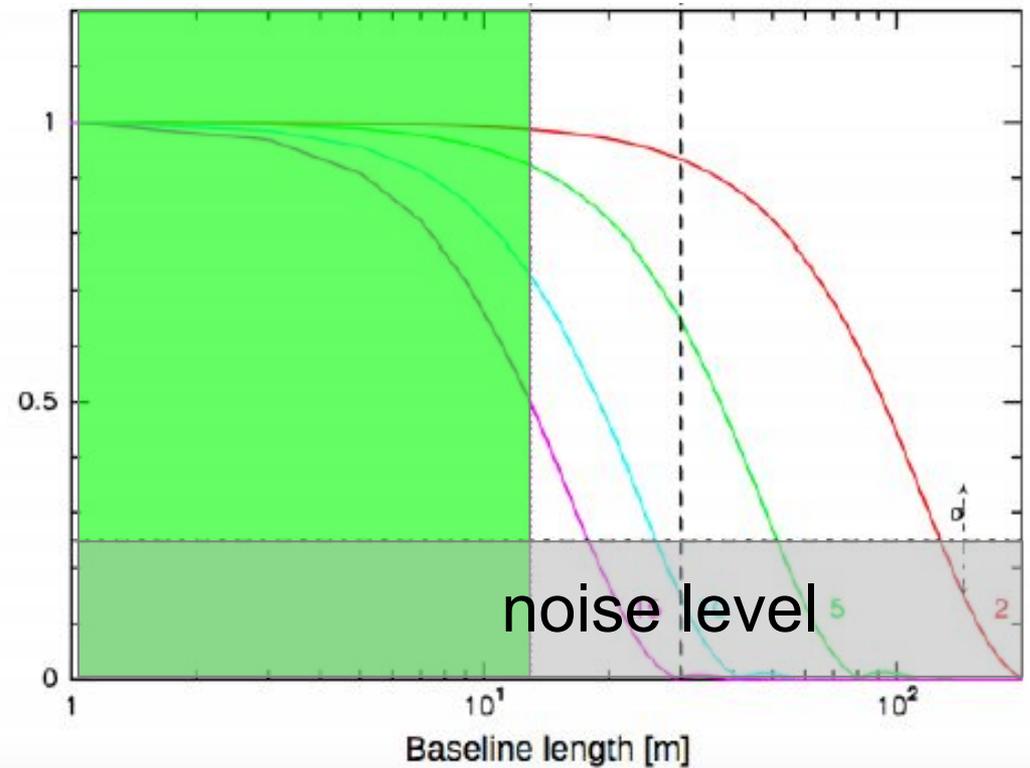

# (u,v) sampling vs Maximum recoverable scale (MRS)

$$\Theta_{\text{MRS}} \sim \lambda / B_{\text{min}}$$

More compact is the array configuration, less is the filtered large scale emission

## Gaussian sources

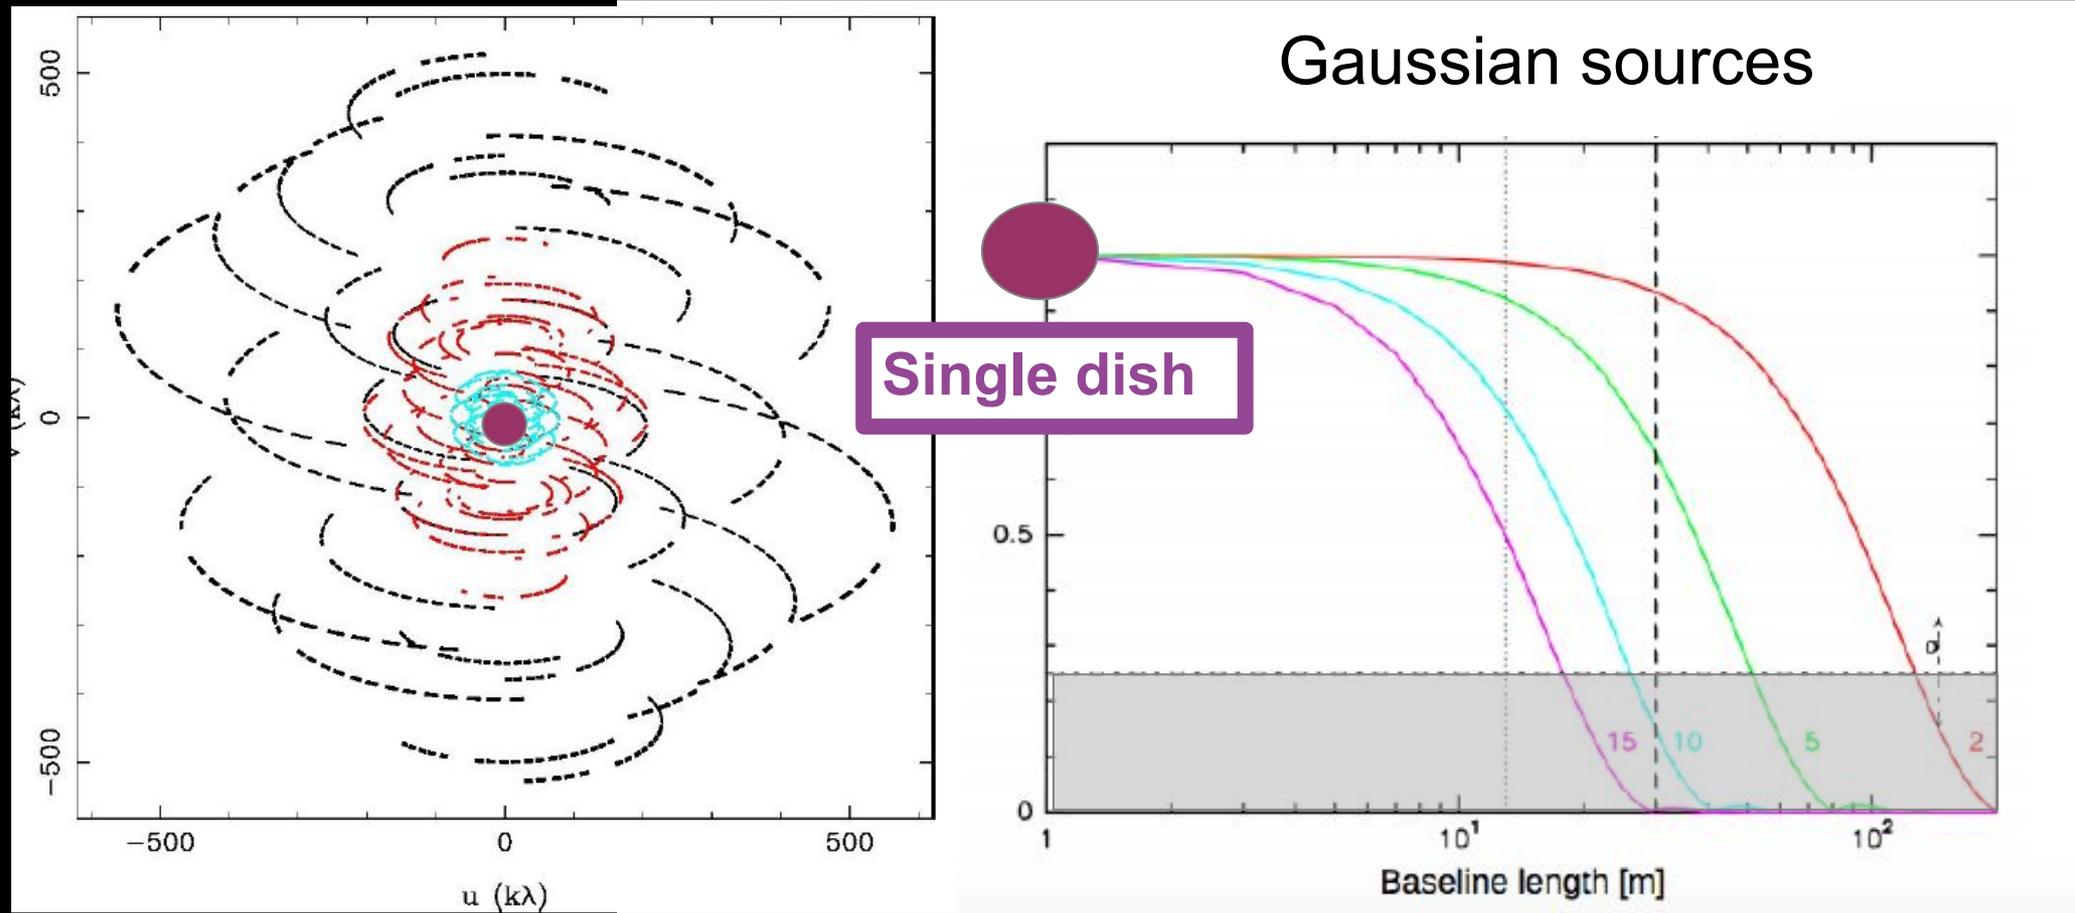

# (u,v) sampling vs Maximum recoverable scale (MRS)

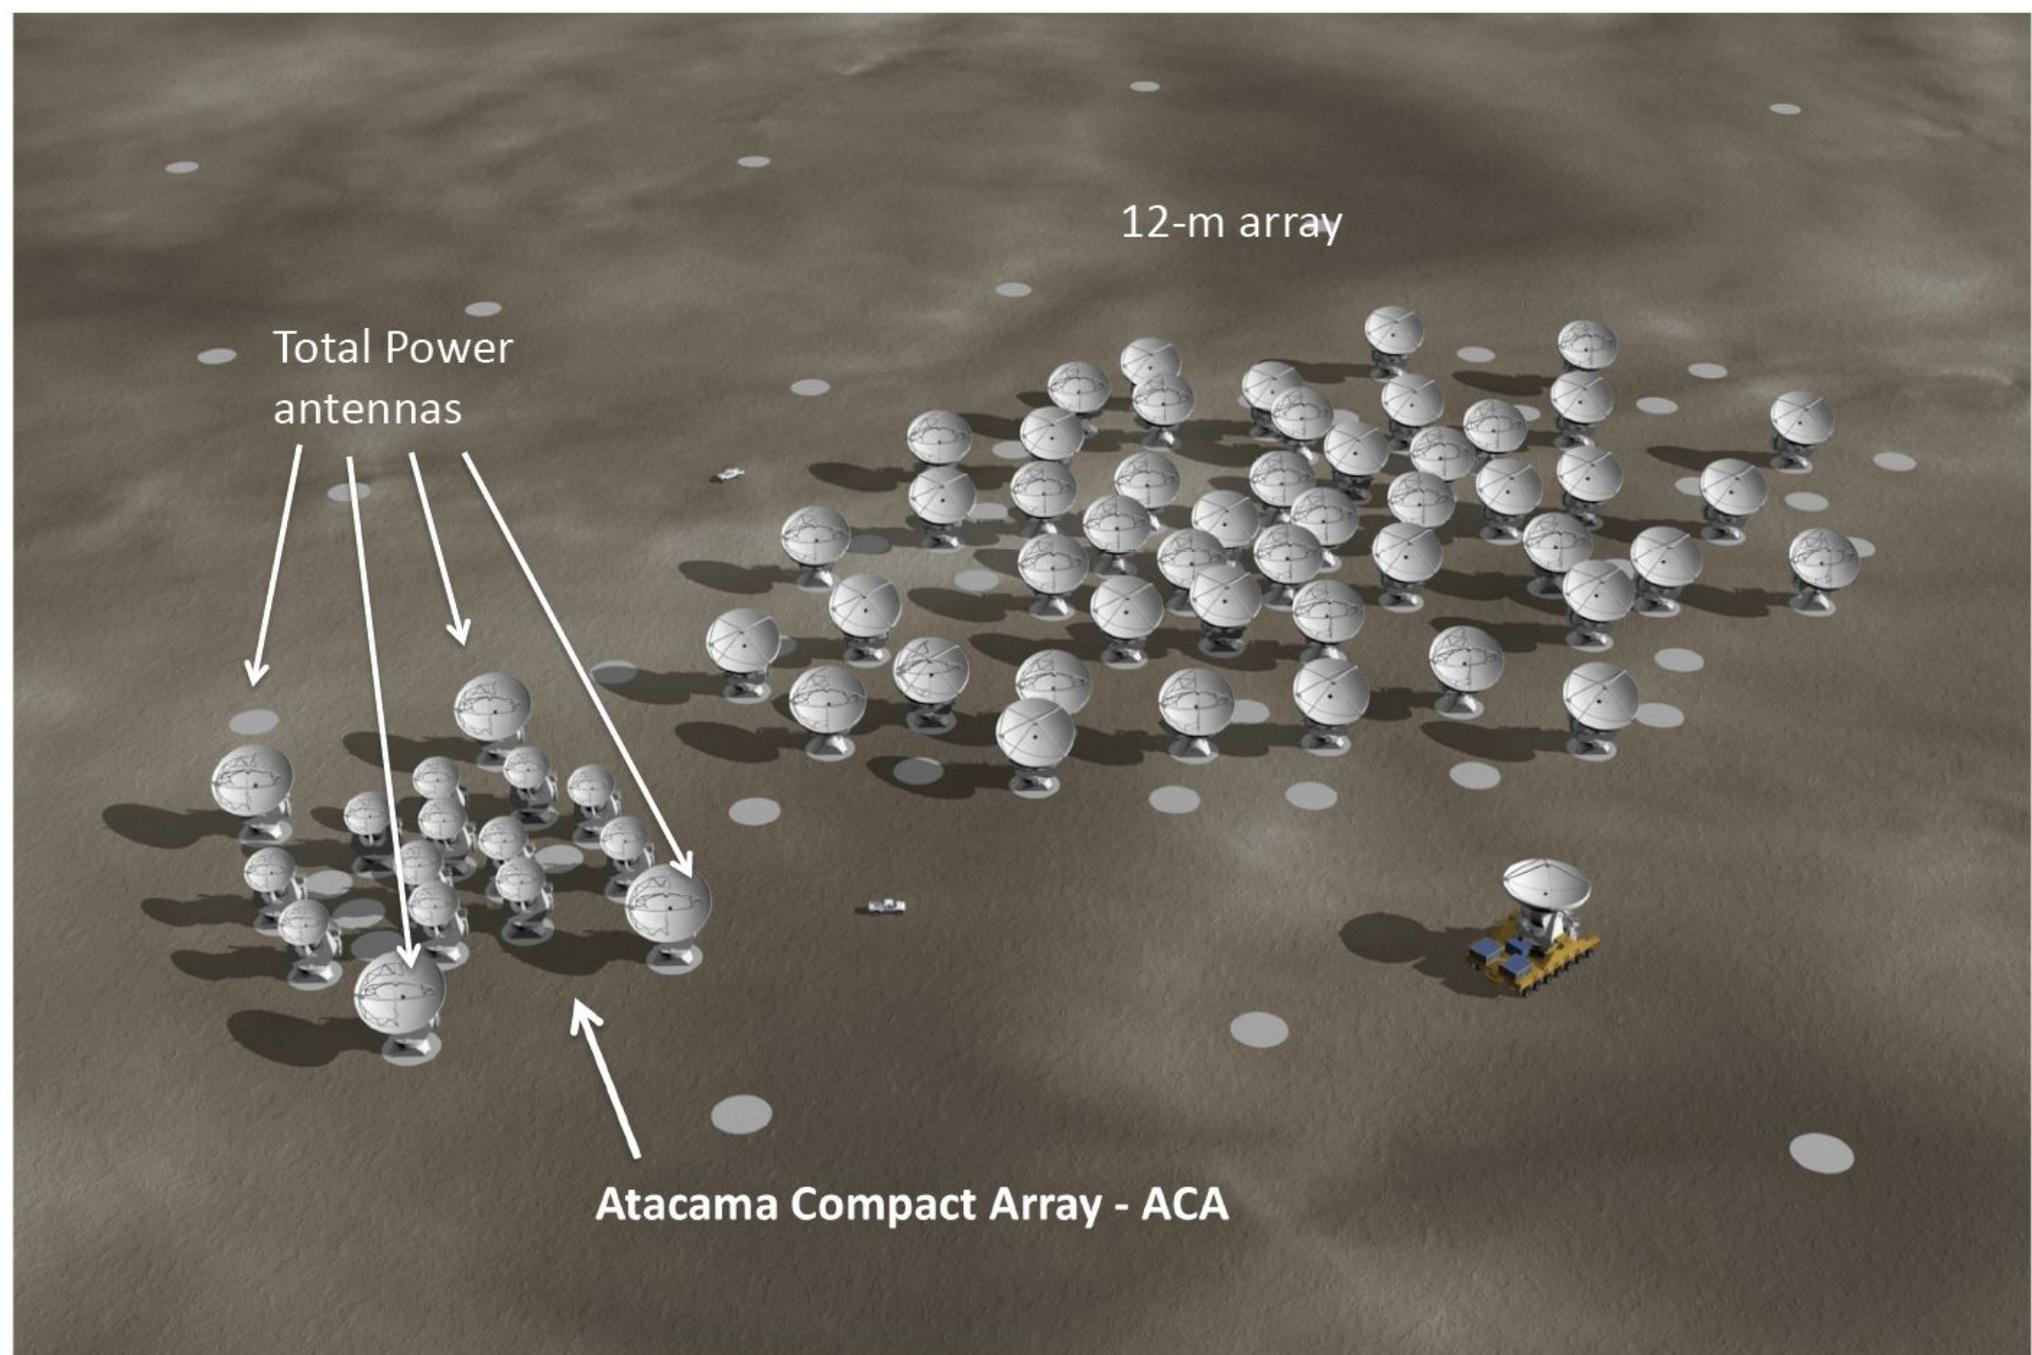

Pair of antennas have physical distance

→ interferometry can not observe zero space flux

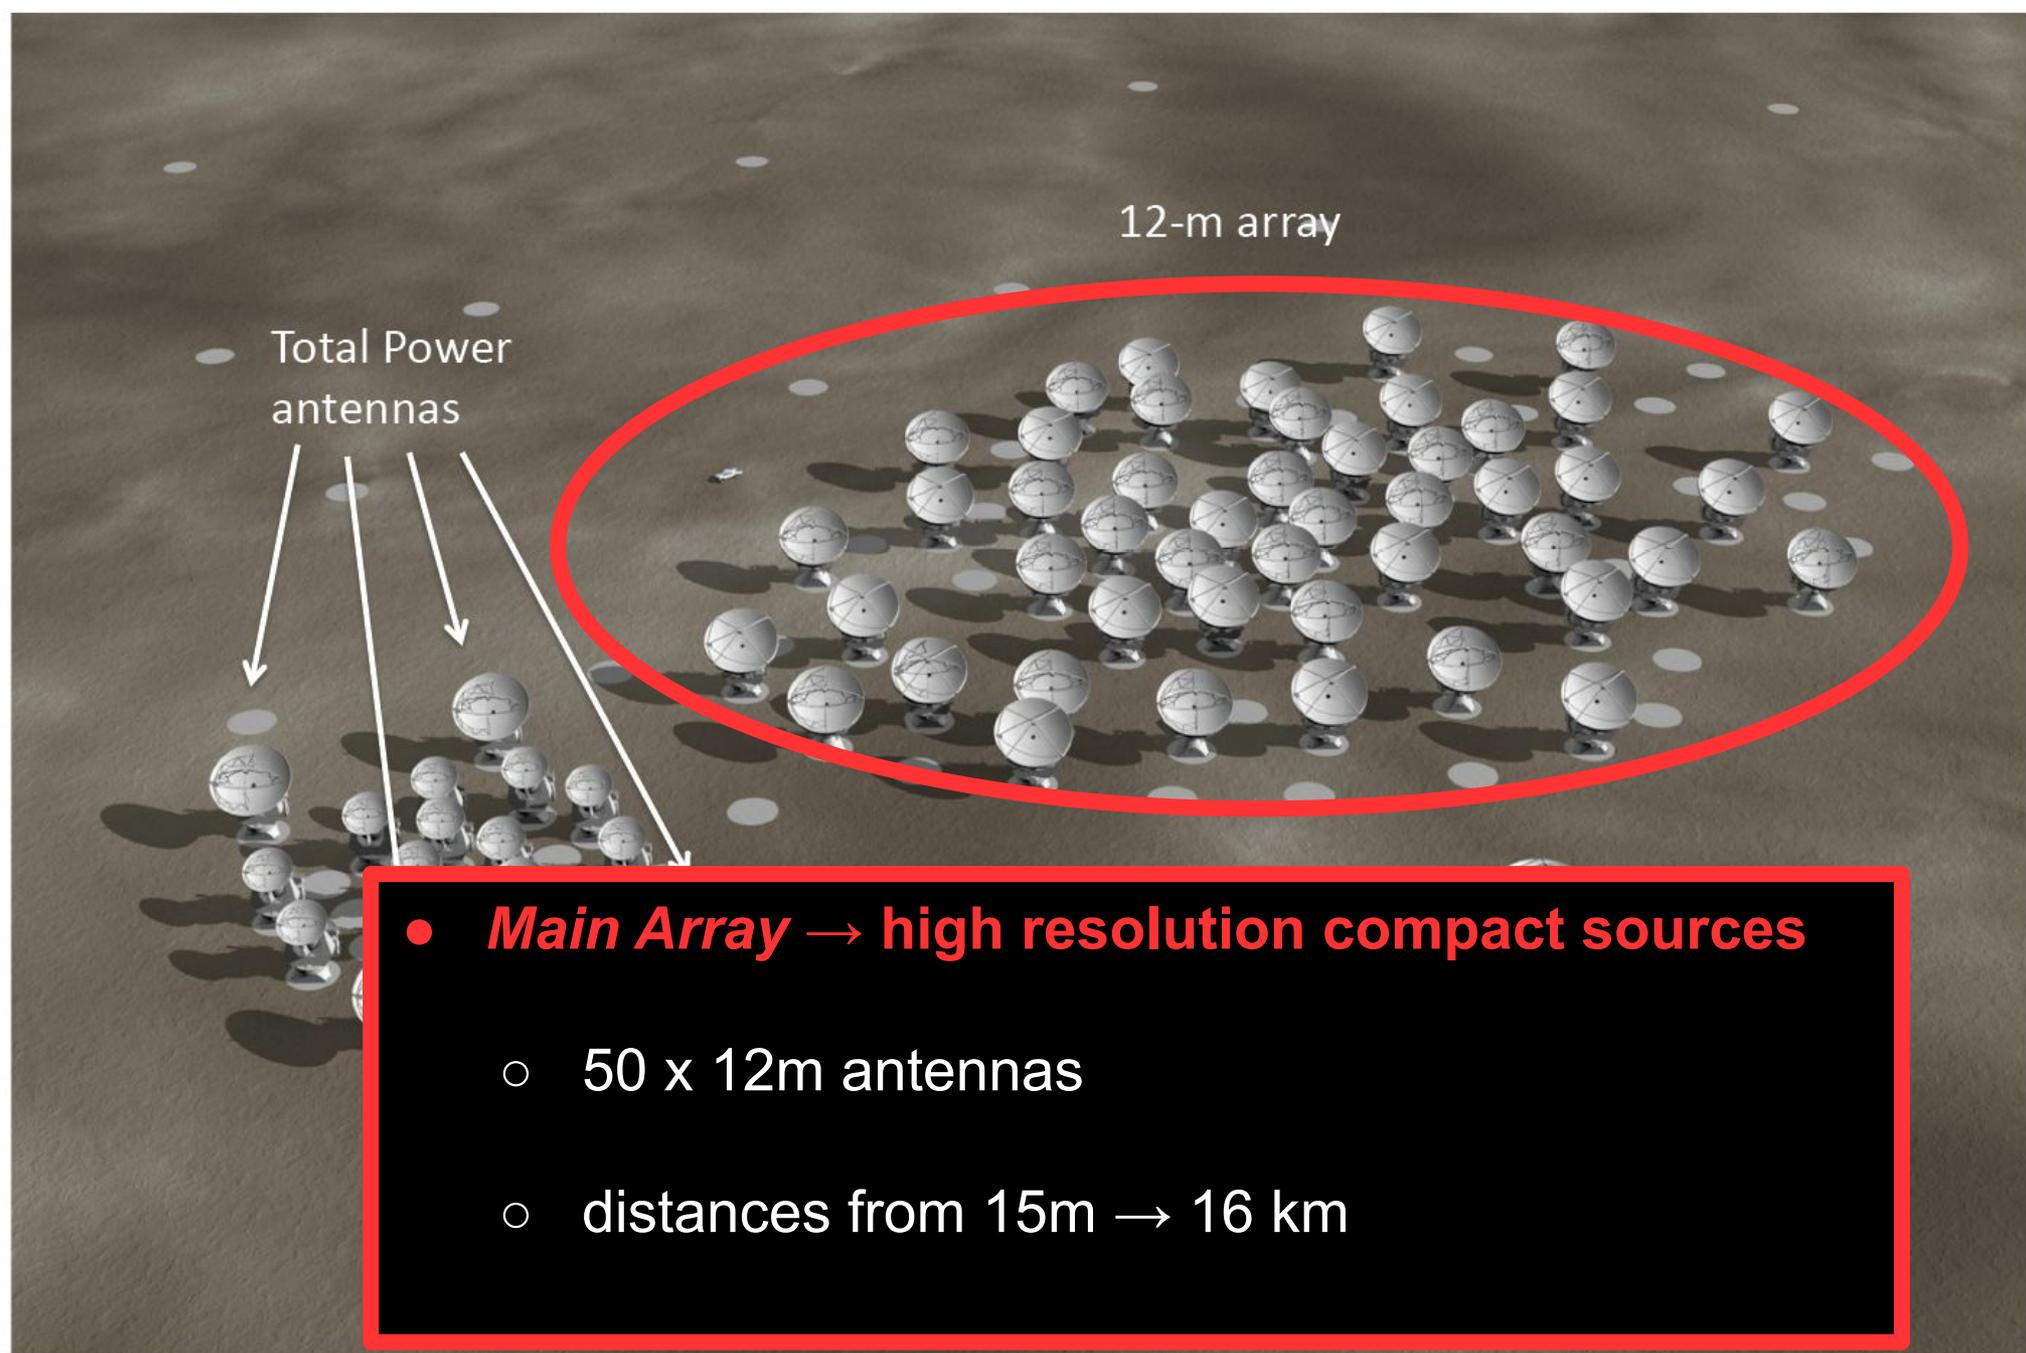

→ We need total power observations to recover the zero spacing flux

# ALMA is a composite interferometry

# ALMA Main Array

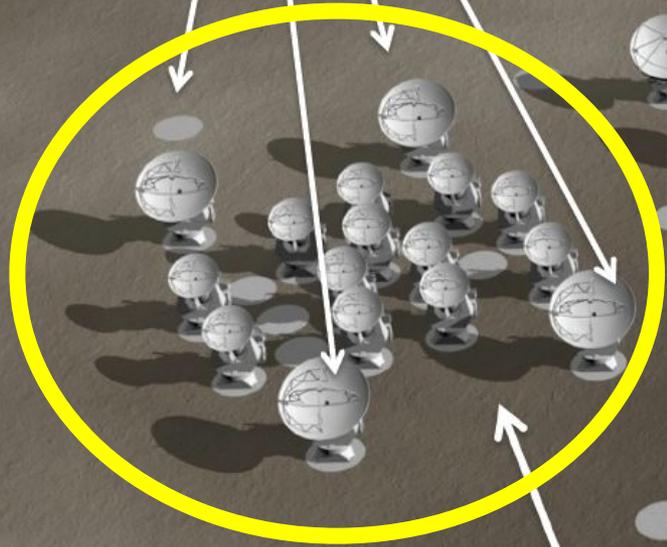

# ALMA compact array (ACA)

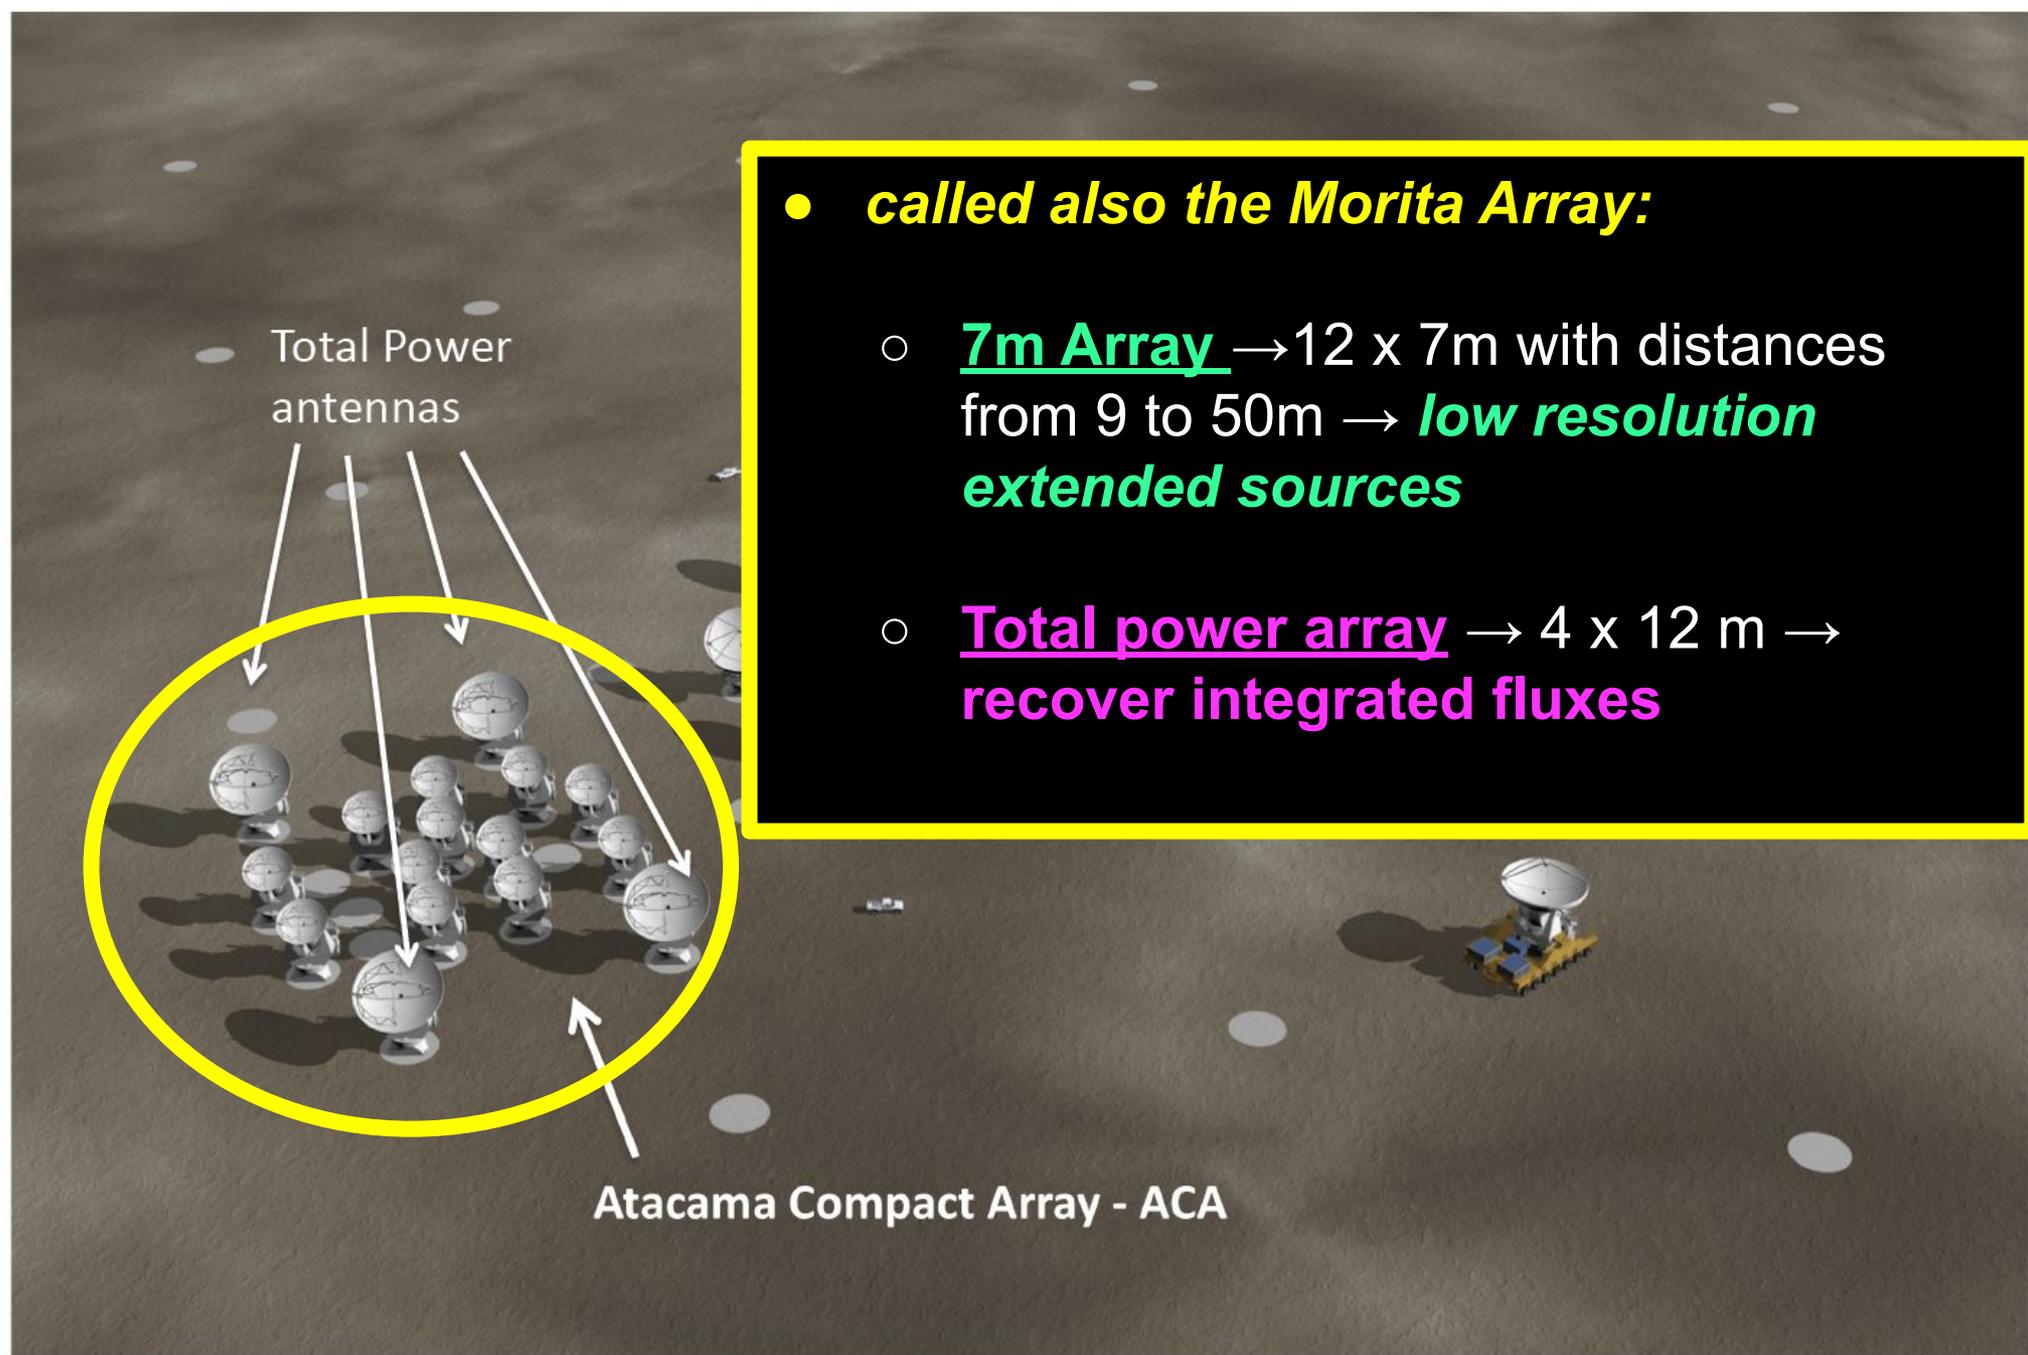

- **called also the Morita Array:**

- **7m Array** → 12 x 7m with distances from 9 to 50m → **low resolution extended sources**
- **Total power array** → 4 x 12 m → **recover integrated fluxes**

Total Power  
antennas

Observing time 1.5 hrs

# ALMA sensitivity

$T_{\text{sys}}$  is the system temperature ( $=T_{\text{atm}} + T_{\text{rx}}$ )

Boltzmann  $k$

$$\sigma_S \approx \frac{2 k T_{\text{sys}}}{A_{\text{eff}} \sqrt{n(n-1)} \times \Delta\nu \times \eta_{\text{pol}} \times t_{\text{int}}} \text{ [Jy]}$$

Effective collecting Area = dish\_area x efficiency

$n = \#$  of antennas  
 $n(n-1)/2 = \#$  of baselines

Time on source

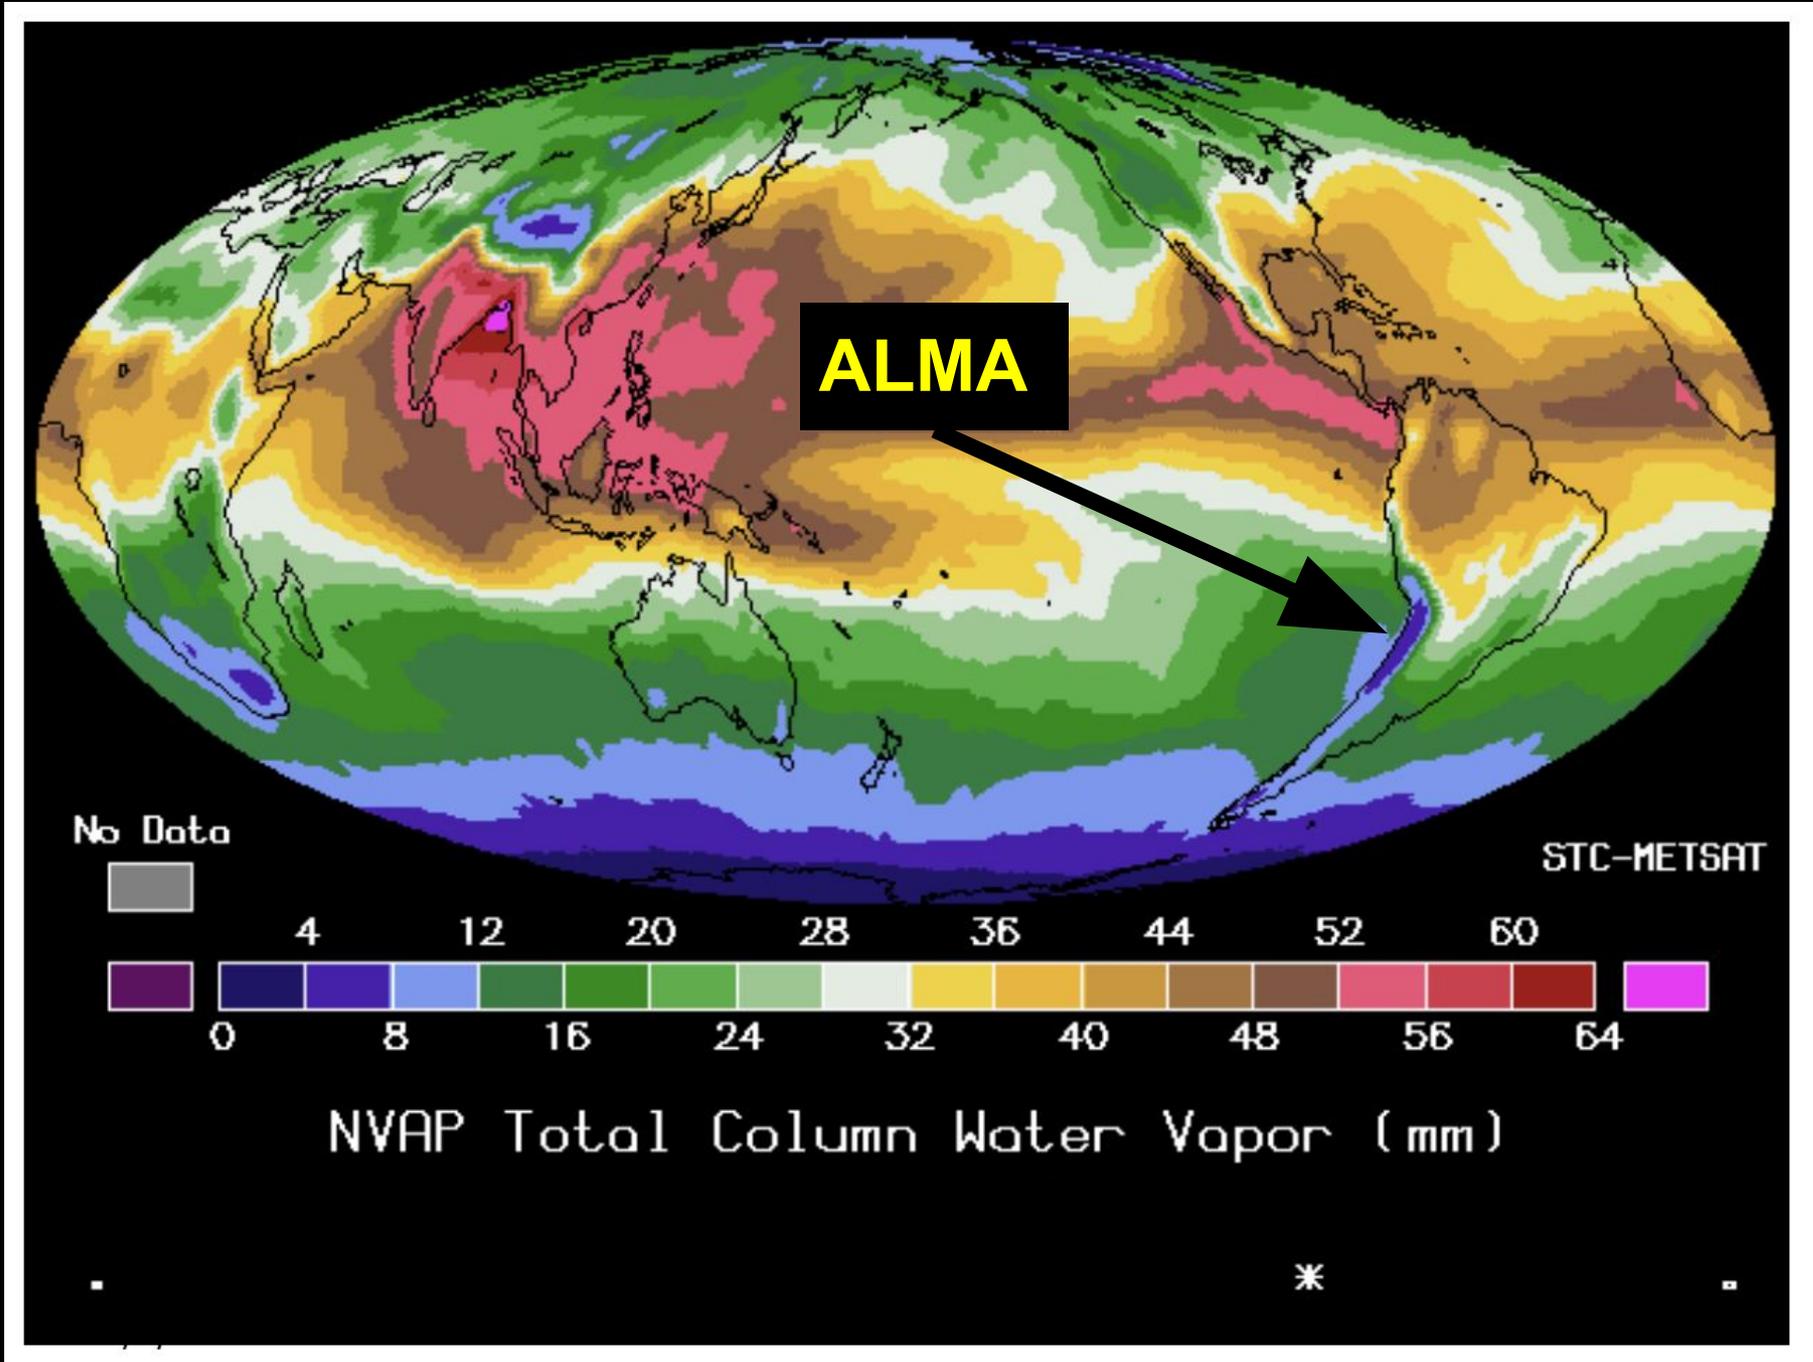

# of polarizations

Bandwidth

Low values thanks to:

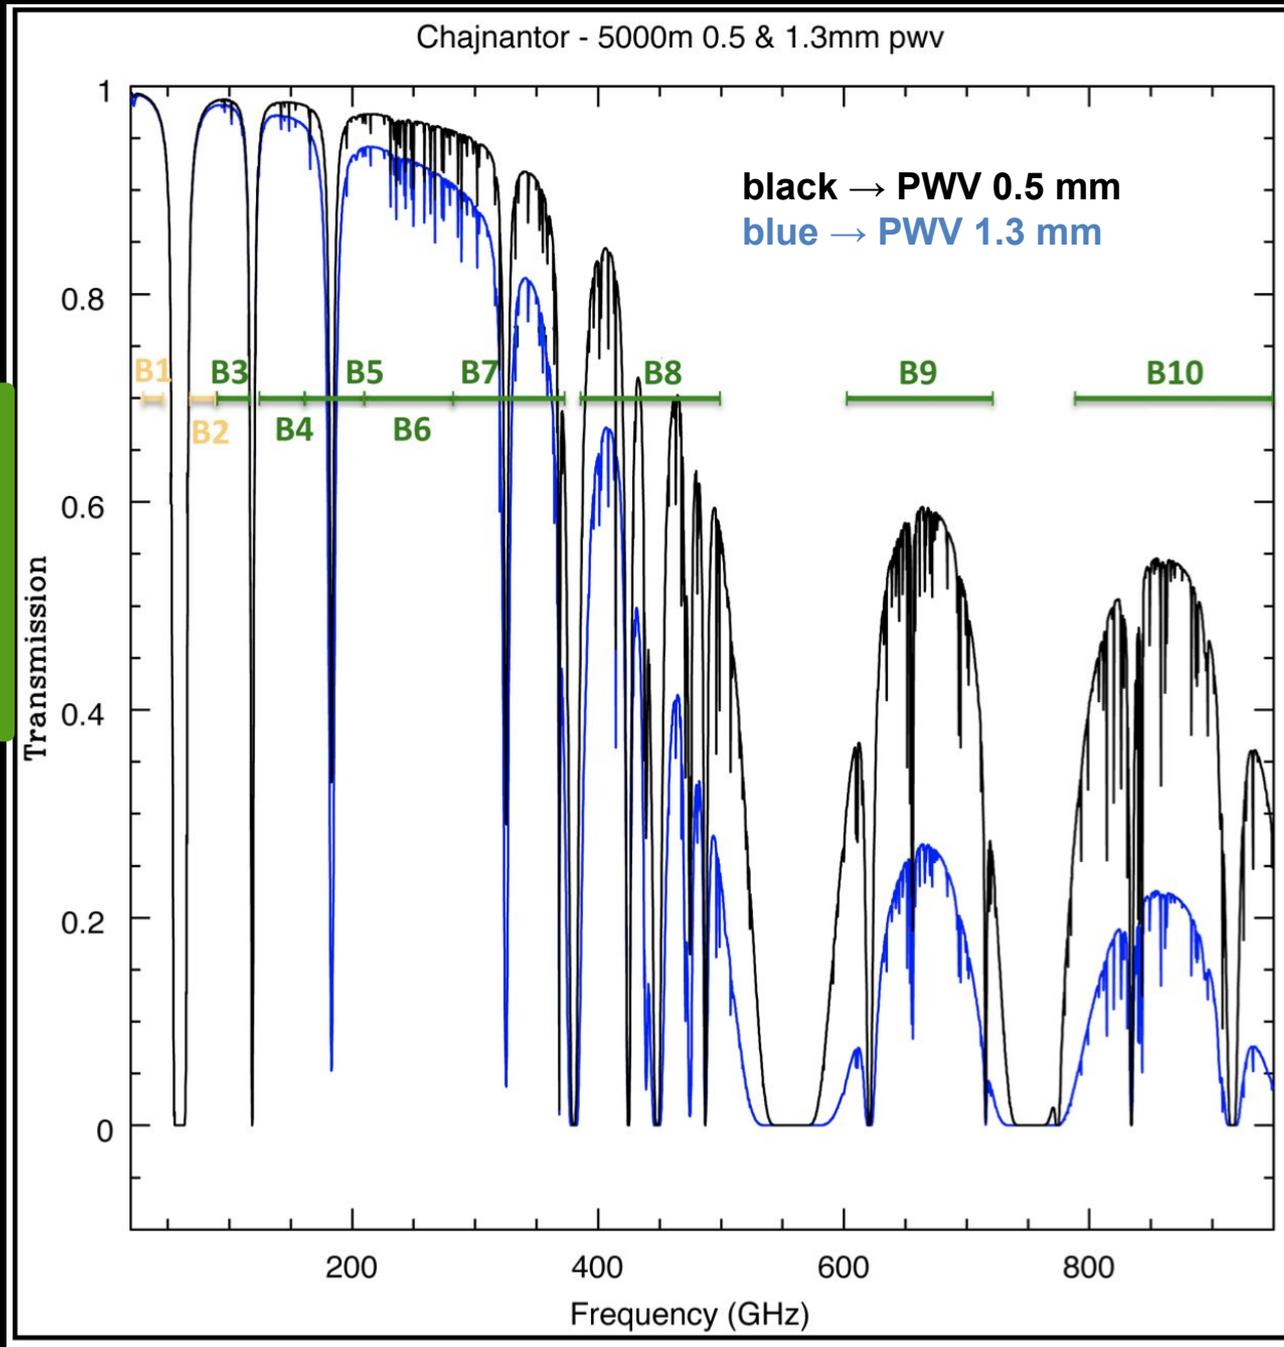

- **low  $T_{\text{sys}}$**  (= lowering instrumental noise or atmospheric noise, i.e. choosing sites with low water vapour levels)
- large **collecting area and/or # of antennas**
- large **bandwidth and the observing time**

# ALMA is at very dry site

# Lowest $T_{\text{sys}}$ - the ALMA B3

BAND 3 - 100 GHz

$T_{\text{sys}} < 100$  K  
below 100 GHz

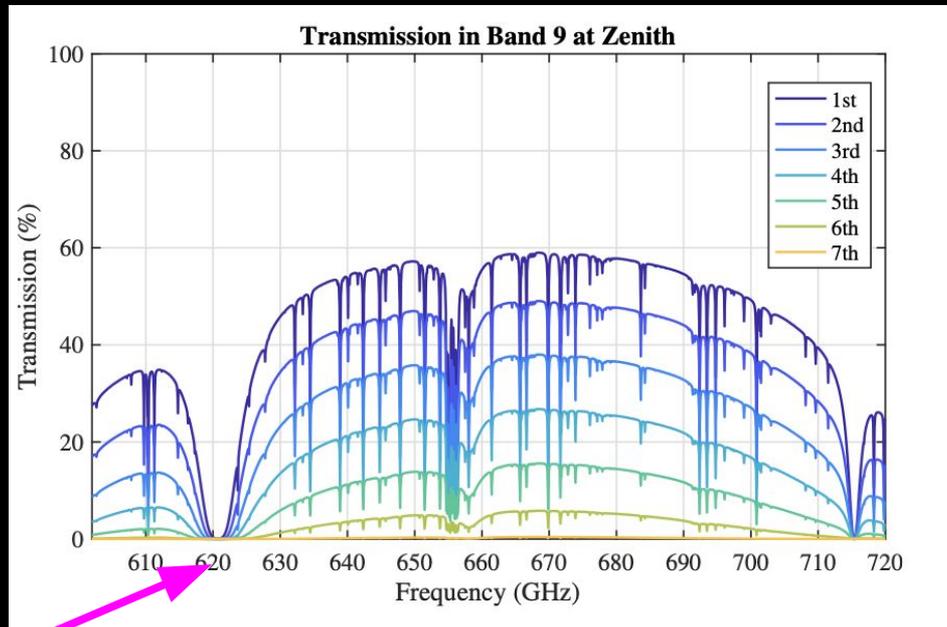

edge of an  $\text{O}_2$   
absorption line at  
118.5 GHz

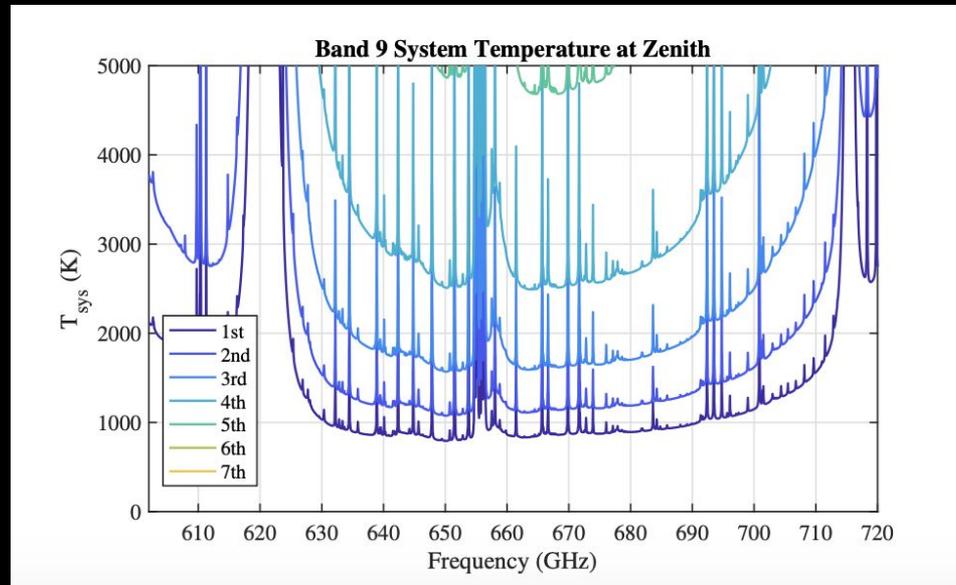

# Higher Tsys - ALMA B9

BAND 9 - 660 GHz

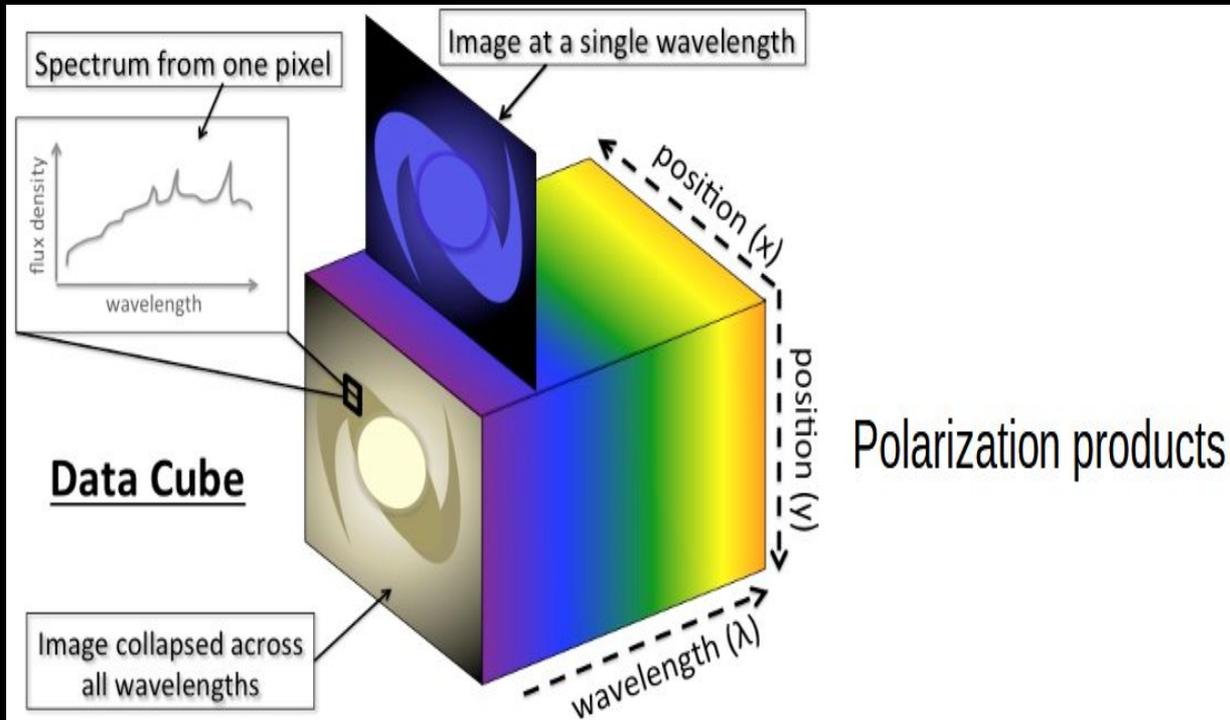

presence of wings of pressure-broadened  $H_2O$  at 620 GHz.

$T_{sys} > 1000$  K above 600 GHz

# ALMA spectral resolution

An image is a **cube** with (possible) dimensions **Right Ascension, Declination, frequency, polarization (I, Q, U, V)**

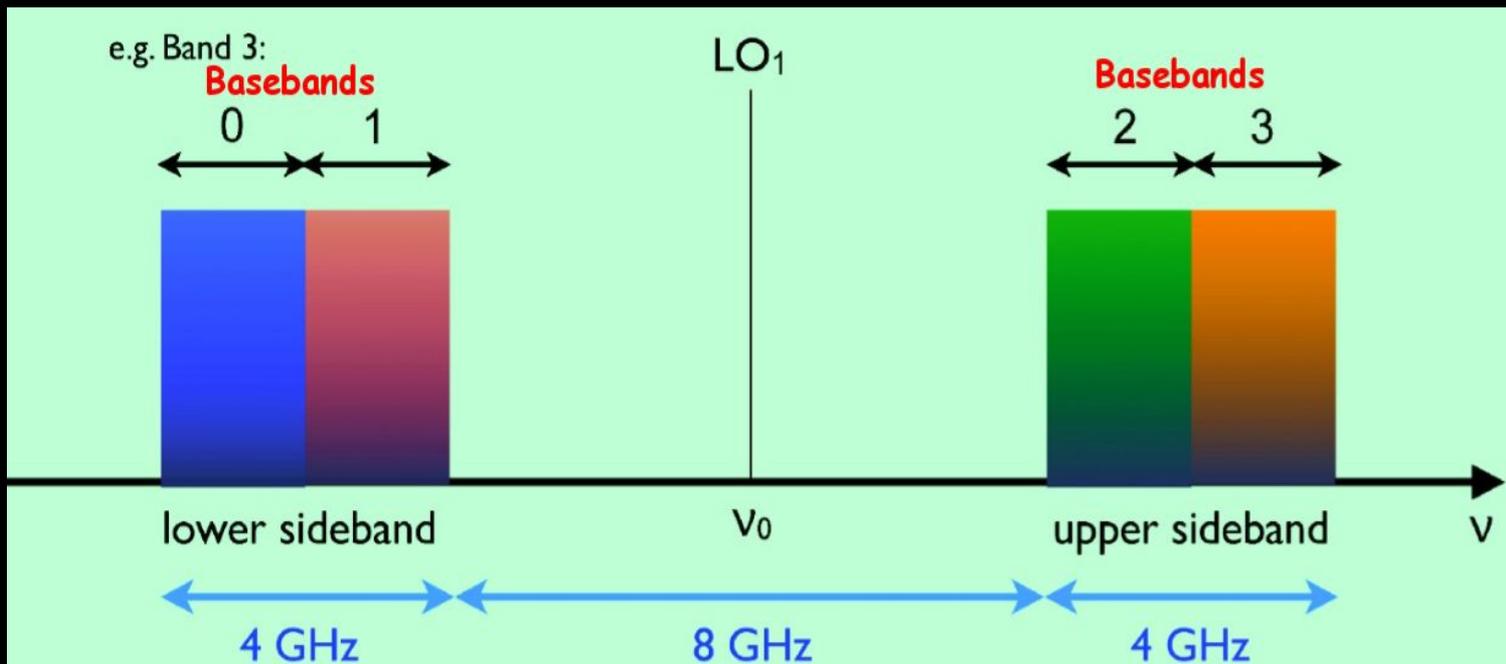

ASA Image units are **Jv/beam**

**!!! See tomorrow tutorial on 'CARTA' !!!**

The **spectral resolution** is the **minimum separation in frequency** whereby adjacent features can be distinguished

**Maximum spectral resolution** depends on how the correlator is set.

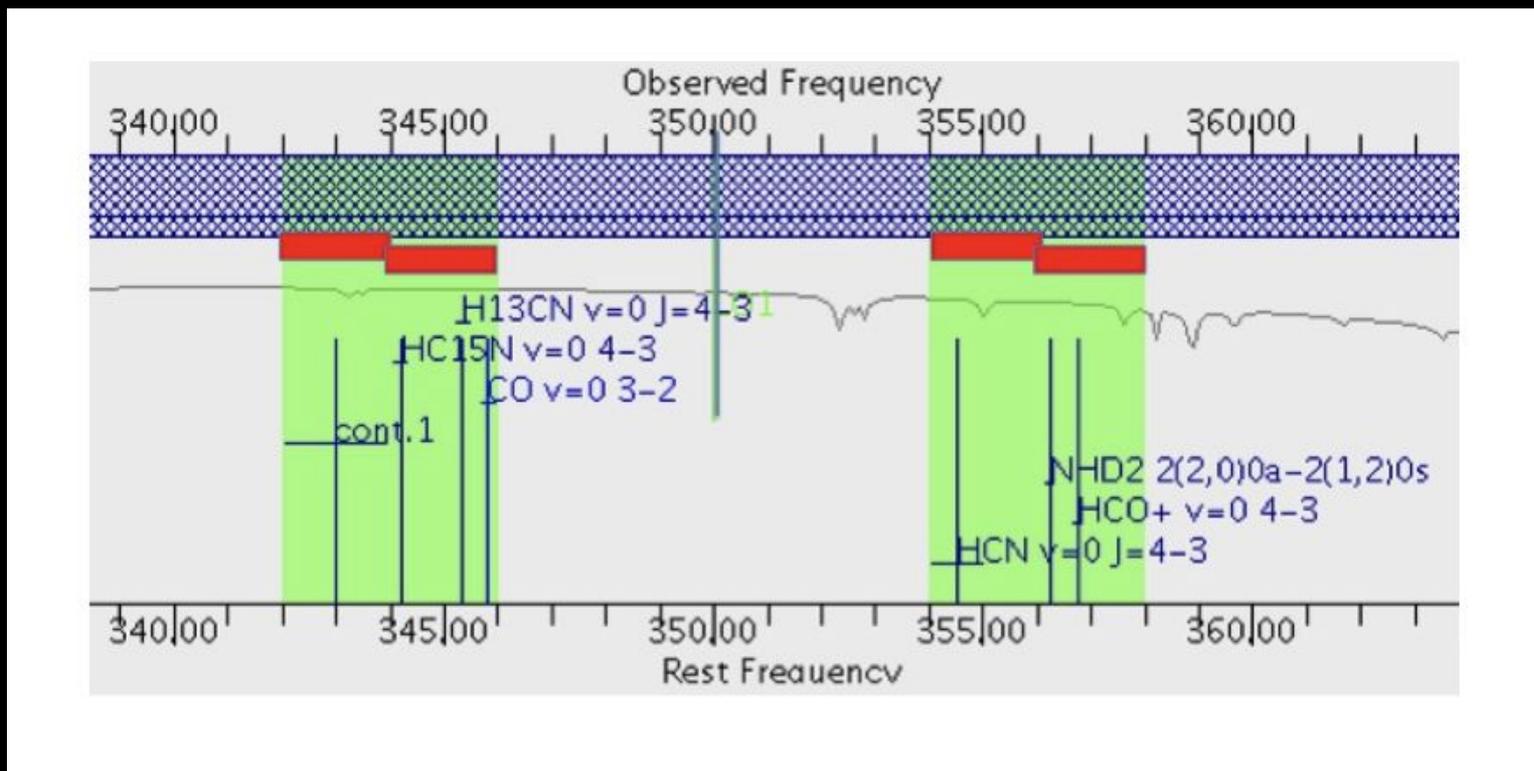

# ALMA data bandwidth

The receivers allows up to **4 x 2 GHz-wide basebands** that can be placed in one sideband or distributed between the 2 Sidebands separated by 8 GHz.  
→ **cover the gap with spectral scan!**

A maximum available **8 GHz bandwidth** is achieved when the 4 basebands are chosen not to overlap.

# ALMA spectral windows

Each baseband may be divided into **one or more spectral windows** depending on the spectral resolution needed.

Archival data reflect the **PI choices**

# ALMA correlator -1

Large number of modes → high flexibility for different science cases

**FDM** → Frequency division mode

small bandwidth

high resolution (spectral lines)

**TDM** → Time division mode

large bandwidth low resolution  
(continuum)

The PI can request to **bin the channels** at the correlator stage (i.e. reduce the resolution in the data) to reduce the data rate

**Table 2: Spectral Capabilities per baseband for observations in dual polarization**

Mode	Polarization*	Band width (MHz)	Nchan	Chan. Spacing (MHz)	Spectral Resolution <sup>†</sup> 300 GHz (km/s)
<i>FDM</i>	<i>Dual</i>	1875	3840	0.488	0.98

# ALMA project types

The project code encloses information on the project itself:

2011 . 1 . 01234 . S

year of submission  
of the first proposal

sequential number  
of submitted  
proposal

sequential number of  
the call for proposal  
issued in that year

[ALMA technical handbook: Chapter 8](#)

Letter to identify some of the classes  
of project:  
S= STANDARD  
T= TARGET OF OPPORTUNITY  
V= VLBI  
L= LARGE PROGRAM

Observing modes: Solar, mosaic, single field,  
polarization, spectral line

What archived for each project type?

- **S and T** : raw data and QA2 scripts and products
- **V** : phased visibilities
- **L** : raw data and QA2-light/pipeline scripts and products. PIs are requested to feed additional/final products to be distributed as “external”

# ASA DATA quality assessment (QA)

ALMA QA aims to check if the final data products reached the desired PI angular resolution and sensitivity i.e. **ALMA performs science-goal-oriented service data analysis**

## QA0:

near-real time verification of weather and hardware issues carried out on each execution block immediately after the observation.

## QA1:

verification of longer-term observatory health issues like absolute pointing and flux calibration.

## QA2:

offline calibration and imaging (using CASA) of a completely observed MOUS. Performed by expert analysts distributed at the JAO and the ARCs with the help of the ALMA Pipeline. Results are archived and given to the PI.

## QA3: (optional)

PIs may request re-reduction, problem fixes, possibly re-observation

[ALMA technical handbook: Chapter 11](#)

# Summary in practice

- **Field of View**  
→ single pointing or mosaic?

$$FOV \propto \frac{\lambda}{D}$$

- **Angular resolution**  
→ array configuration?

$$\theta_{res} \approx \frac{\lambda}{B_{max}}$$

- **Maximum recoverable scale**  
→ total power observations?

$$\theta_{MRS} \approx \frac{\lambda}{B_{min}}$$

- **Sensitivity**  
→  $\Delta\nu$  of spectral obs?

$$\sigma_S \approx \frac{2 k T_{sys}}{A_{eff} \sqrt{n(n-1)} \times \Delta\nu \times \eta_{pol} \times t_{int}} \text{ [Jy]}$$

- Interferometer measures  $\mathbf{V(u,v)} = \mathbf{FT}(\mathbf{T(x,y)})$   
→ Calibration of  $V(u,v)$  ( $=A, \Phi$  vs  $\nu$  t), imaging is  $\mathbf{FT}^{-1}(V(u,v))$

- In the mm, the **troposphere effects** on  $\Phi$  (due to PWV and dry components) are dominant and increase with  $\nu$  and  $b$  → high  $\nu$  and long  $b$  observations more difficult.

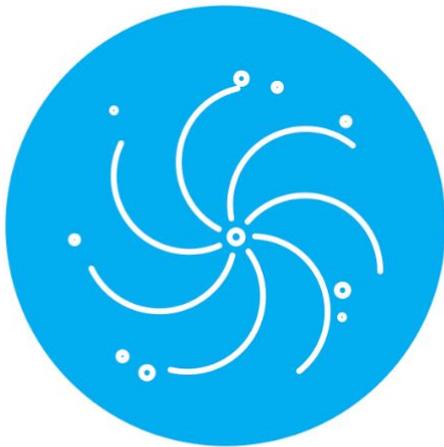

- **Image fidelity** strongly depends on the  $(u,v)$  coverage and source dynamic range  
→ best  $(u,v)$  coverage, selfcal needed?

# Perspectives

## ALMA development Roadmap 2030

The Working Group proposes the following fundamental science drivers for ALMA developments over the next decade:

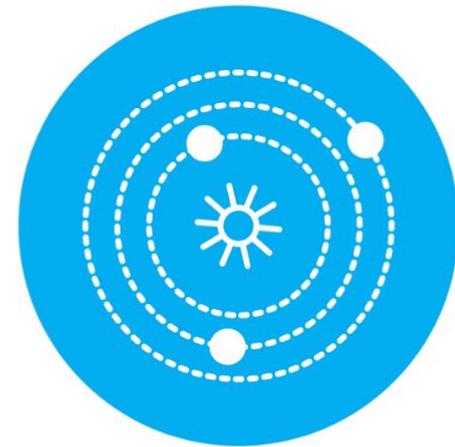

### ORIGINS OF GALAXIES

Trace the cosmic evolution of key elements from the first galaxies ( $z > 10$ ) through the peak of star formation ( $z = 2-4$ ) by detecting their cooling lines, both atomic ([CII], [OIII]) and molecular (CO), and dust continuum, at a rate of 1-2 galaxies per hour.

### ORIGINS OF CHEMICAL COMPLEXITY

Trace the evolution from simple to complex organic molecules through the process of star and planet formation down to solar system scales ( $\sim 10-100$  au) by performing full-band frequency scans at a rate of 2-4 protostars per day.

### ORIGINS OF PLANETS

Image protoplanetary disks in nearby (150 pc) star formation regions to resolve the Earth forming zone ( $\sim 1$  au) in the dust continuum at wavelengths shorter than 1mm, enabling detection of the tidal gaps and inner holes created by planets undergoing formation.

# The next year ASA development

## ALMA development Roadmap 2030

## 5. ARCHIVE DEVELOPMENT

The Working Group concurs with the ALMA 2030 report that the ALMA Science Archive will become the primary source for an increasing number of publications. The ability to efficiently mine the archive contents is therefore vital for the community and ALMA's future. With the expansion of the receiver bandwidth and the upgraded correlator envisioned here, not only will the archive capacity need to be increased, but also the capabilities will need to be enhanced to exploit the rich repository of spectra.

The current ALMA archive provides the basic functionality to search and download data, and the complementary Japanese Virtual Observatory (JVO) provides impressive functionality to visualize data cubes. In addition, the ALMA Archive Working Group has produced a 5-year development plan that will provide additional functionality to facilitate archival research. While the cost of further archive upgrades is likely much less than envisioned for the package of receiver, digital system, and correlator, careful planning is nonetheless required to anticipate the needs of the community.

The Working Group recommends that a committee is formed and tasked with prioritizing the scientific functionality that will be needed in the ALMA archive over the next decade, with particular attention toward mining the archival spectra produced by the receiver upgrades.

## Publication acknowledgement

Publications making use of ALMA data must include the following statement in the acknowledgement:

*"This paper makes use of the following ALMA data: ADS/JAO.ALMA#2011.0.01234.S. ALMA is a partnership of ESO (representing its member states), NSF (USA) and NINS (Japan), together with NRC (Canada), MOST and ASIAA (Taiwan), and KASI (Republic of Korea), in cooperation with the Republic of Chile. The Joint ALMA Observatory is operated by ESO, AUI/NRAO and NAOJ."*

Please substitute the place-holder project code 2011.0.01234.S with the code of the data used. Have data from multiple projects been used, please specify this as *"This paper makes use of the following ALMA data: ADS/JAO.ALMA#2011.0.01234.S, ADS/JAO.ALMA#2011.0.02345.S, ADS/JAO.ALMA#2011.0.03456.S. ..."*

### North American authors

In addition, publications from NA authors must include the standard NRAO acknowledgement:

*"The National Radio Astronomy Observatory is a facility of the National Science Foundation operated under cooperative agreement by Associated Universities, Inc."*

### Science Verification data

For [Science Verification](#) data, the codes have the following form: ADS/JAO.ALMA#2011.0.0000X.SV, where X=1 for the TW Hya dataset, X=2 for the NGC3256 dataset, X=3 for the Antennae mosaic, etc.

For Science Verification data which is labeled "Commissioning Test data", the codes have the form ADS/JAO.ALMA#2011.0.0000X.E, where X=1 for the GRB 110715A dataset, X=2 for the Pluto Band 7 TDM dataset, etc.

### Calibrator Catalogue data

For all [Calibrator Catalogue](#) data please use the fixed project code: ADS/JAO.ALMA#2011.0.00001.CAL.
