

Unveiling the structure of barred galaxies with the S⁴G

Taehyun Kim (Seoul National University)

& S⁴G Team

Kartik Sheth (NRAO), **Dimitri Gadotti** (ESO), **Myung Gyoon Lee** (SNU)

Light profile of bars

NGC 1300

Hubble Heritage Team

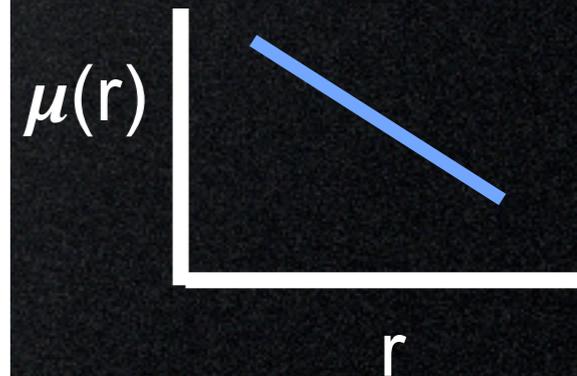

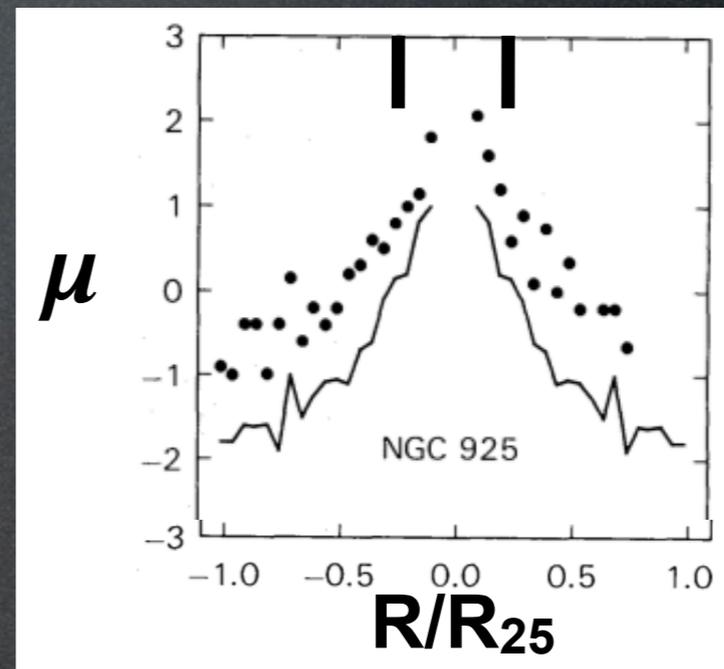

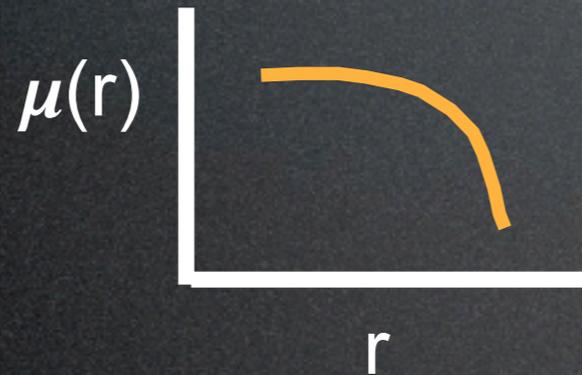

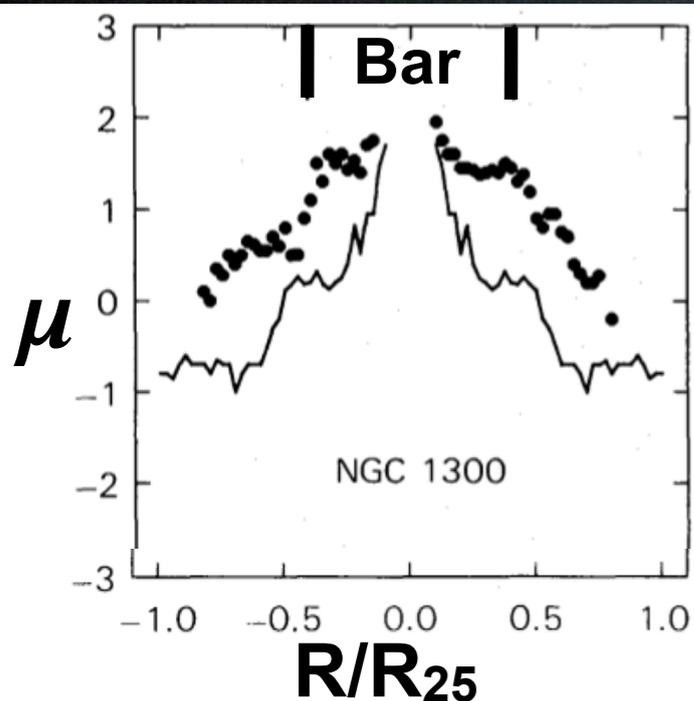

NGC 925

Mt. Lemmon SkyCenter

Flat surface brightness profile

Exponential-like profile

Elmegreen & Elmegreen (1985), Elmegreen+(1996), ~30 Galaxies

Light profile of bars

NGC 1300

Hubble Heritage Team

NGC 925

Mt. Lemmon SkyCenter

Flat surface brightness profile

Exponential-like profile

Bars become **flat** as stars **trapped around x1 orbit** (Athanasoula 2003)

- Locations of resonances (ILRs), resonance crowding

(Combes & Elmegreen 1993; Elmegreen et al. 1996)

Quantifying bar profile to investigate evolution of bars

Shape of bars

Bars are rectangular-shaped (Athanasoula 1990, Gadotti 2011)

Are bar shapes **different**?
Is there any disky bar?
Can these tell us about how bars formed?

The Spitzer Survey of Stellar Structure in Galaxies (S⁴G, Sheth et al. 2010)

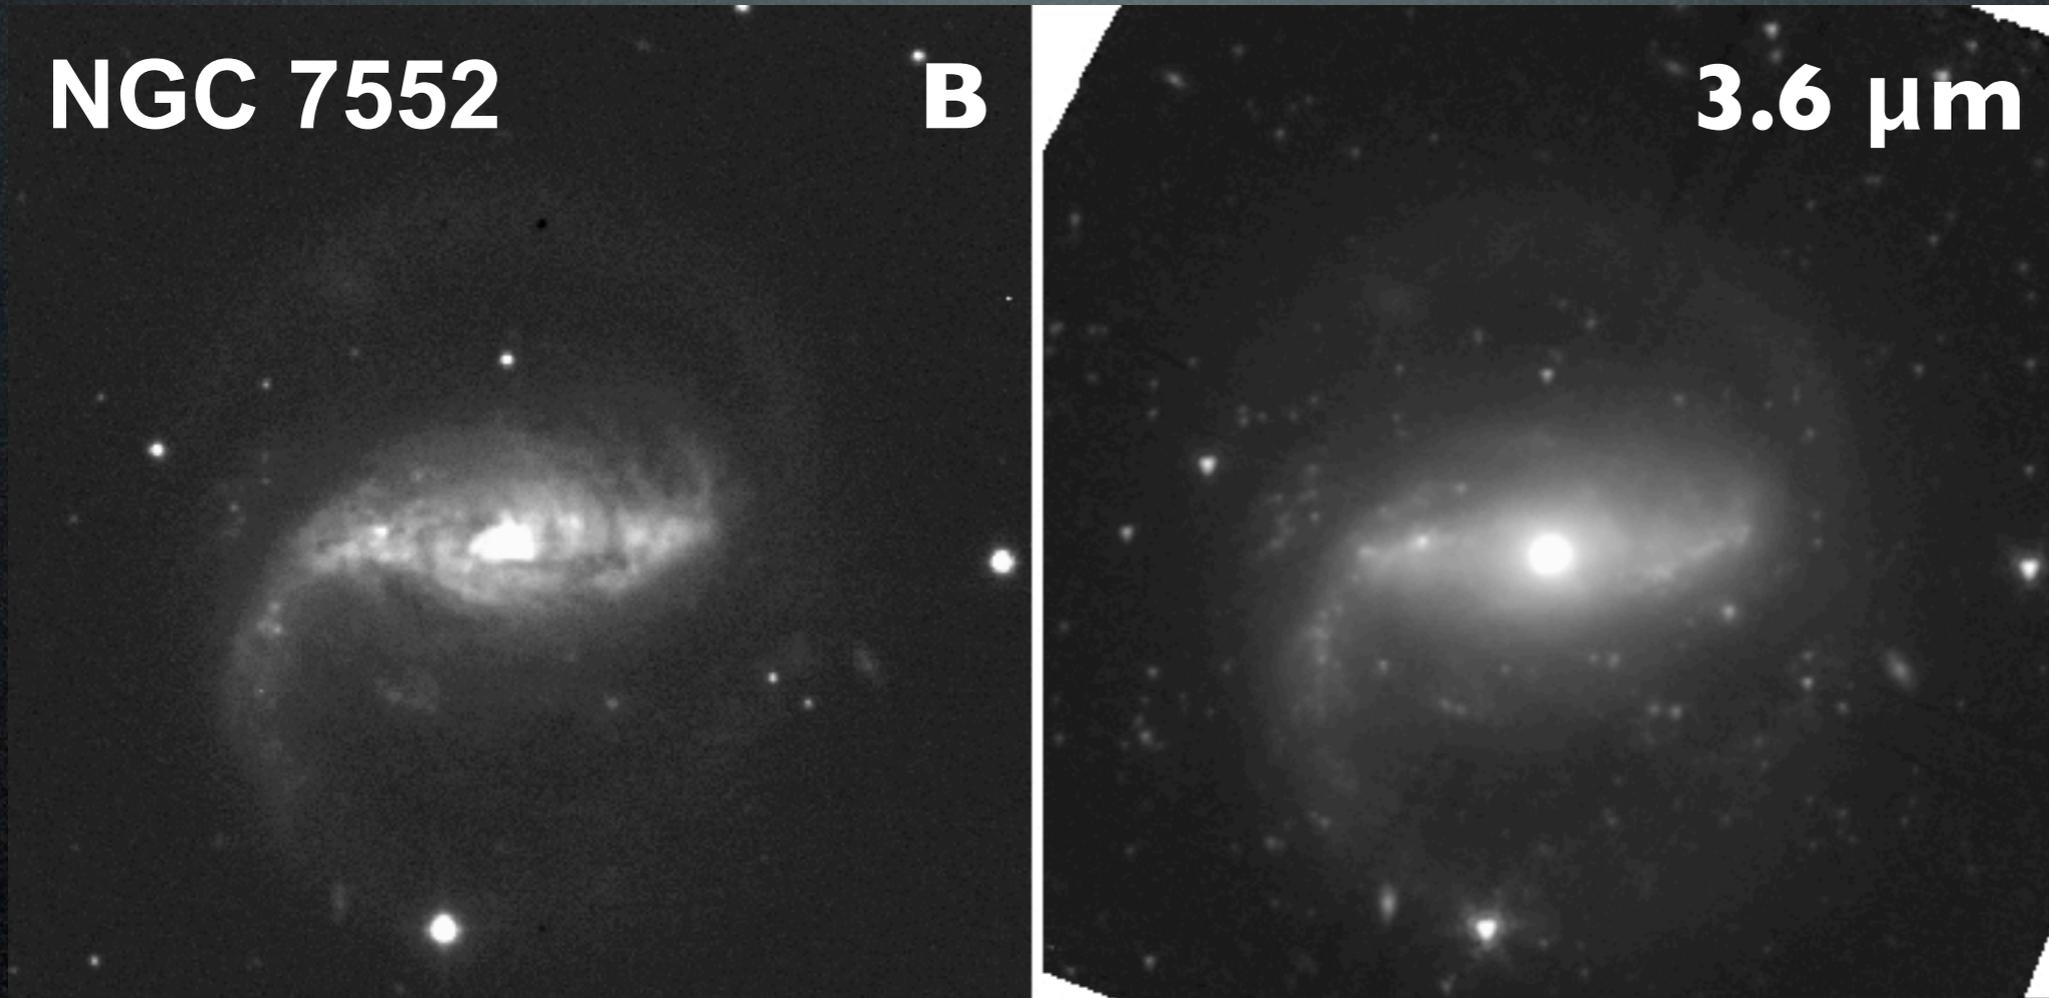

- Survey of ~2,352 galaxies in 3.6 & 4.5 μm

NGC 7552

B

3.6 μm

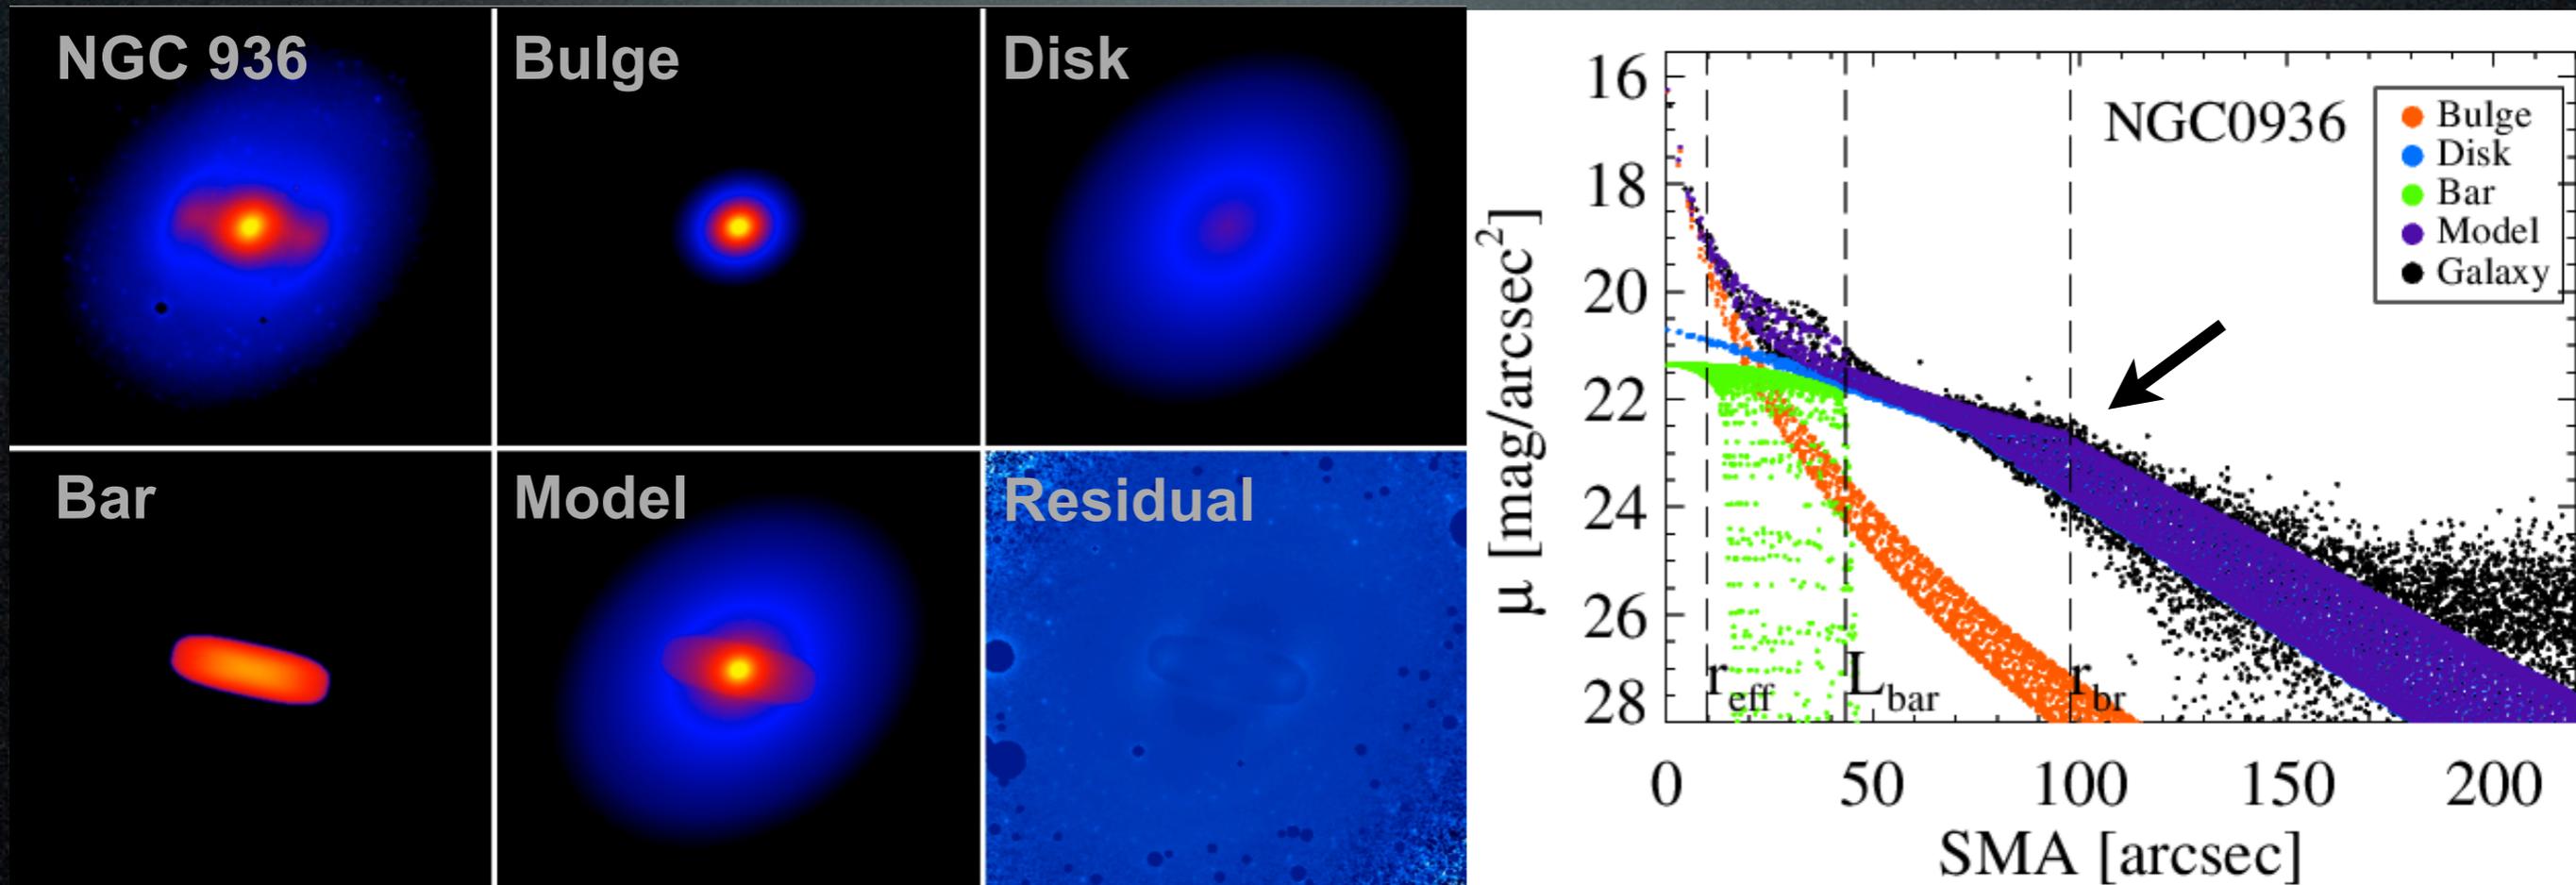

Structural parameters can be affected by dust
(e.g. Gadotti+10, Kelvin+12, Pastrav+13)

Data Analysis - 2D decomposition

BUDDA (Bulge/Disk Decomposition Analysis, de Souza+2004, Gadotti 2008)

144 nearby barred galaxies ($M_{\star}=10^9\sim 10^{11}M_{\text{sun}}$, SB0~SBdm)

Disk breaks are taken into account in our disk model fits

- **80%** of disk galaxies have a disk break (Gutierrez+11)

Deconstructing!

Data Analysis - 2D decomposition

BUDDA (Bulge/Disk Decomposition Analysis, de Souza+2004, Gadotti 2008)

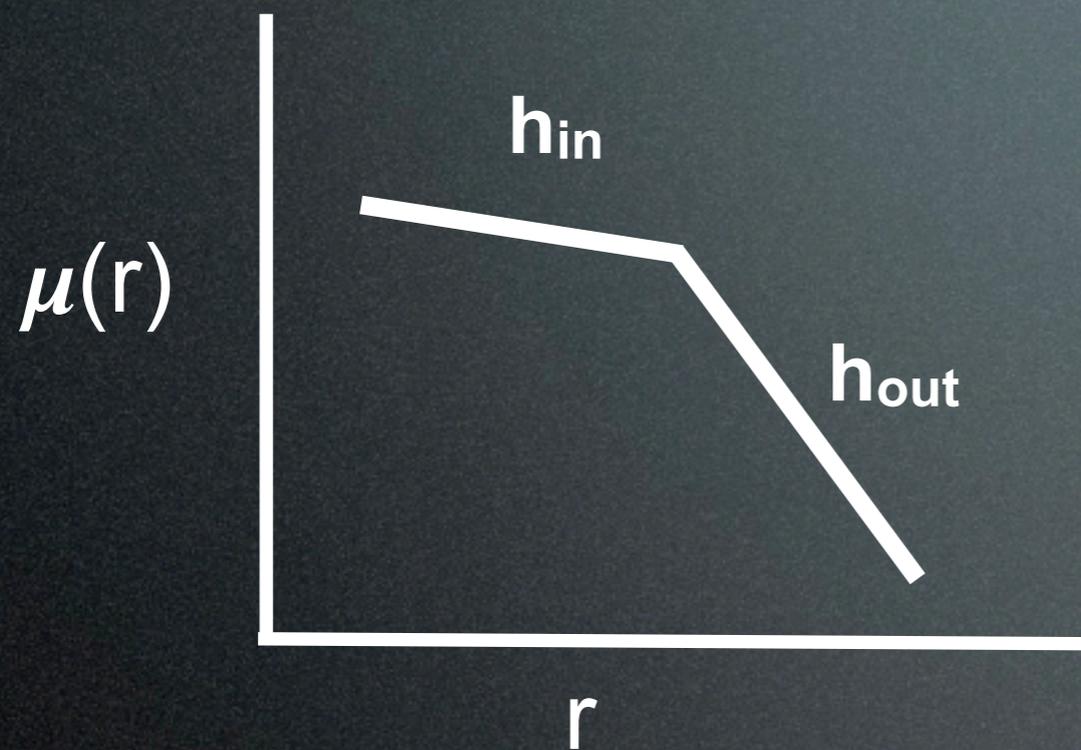

144 nearby barred galaxies ($M_{\star}=10^9\sim 10^{11}M_{\text{sun}}$, SB0~SBdm)

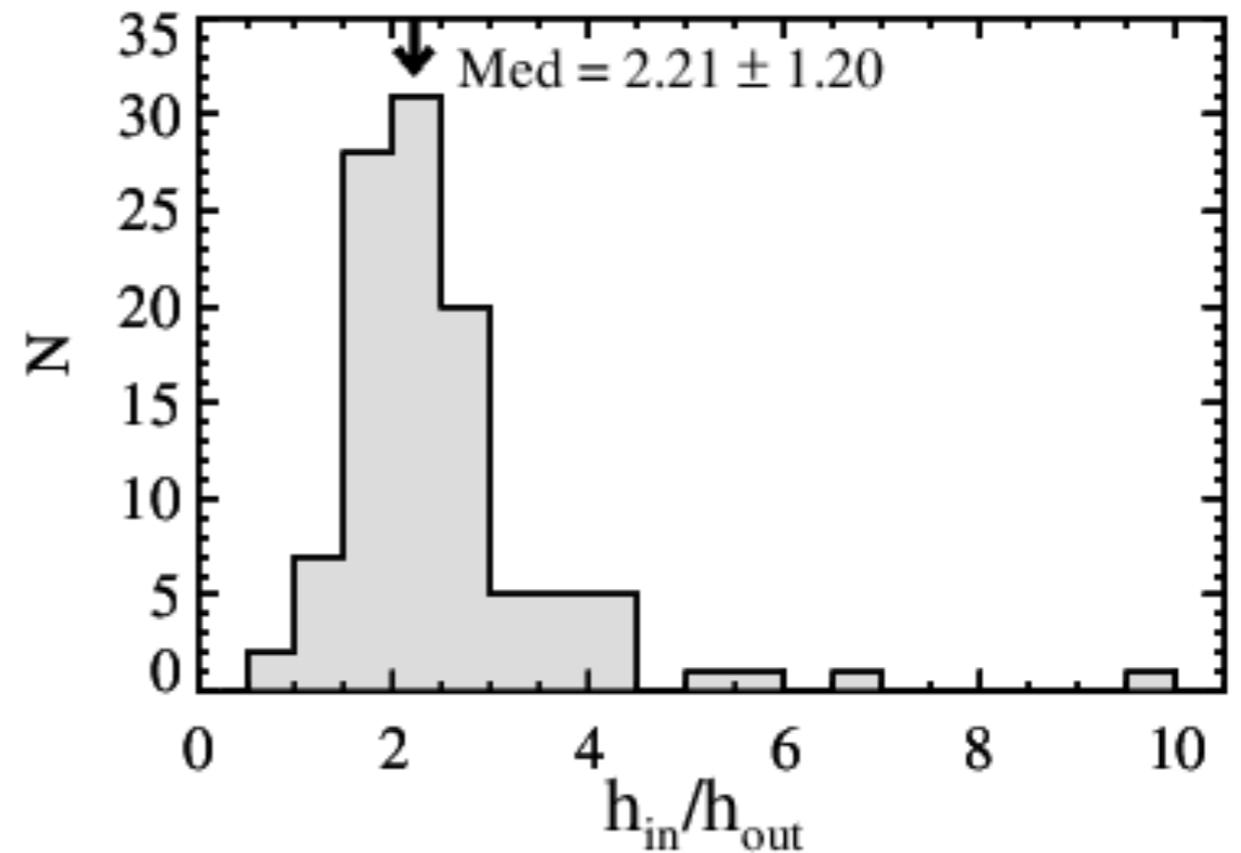

Disk breaks are taken into account in our disk model fits

- **80%** of disk galaxies have a disk break (Gutierrez+11)

Importance of including disk breaks

Type II (down-bending) Disks

Kim et al. (2013, ApJ, submitted)

If disk break is not accounted for,

Disk Scale length changes by $\sim 40\%$

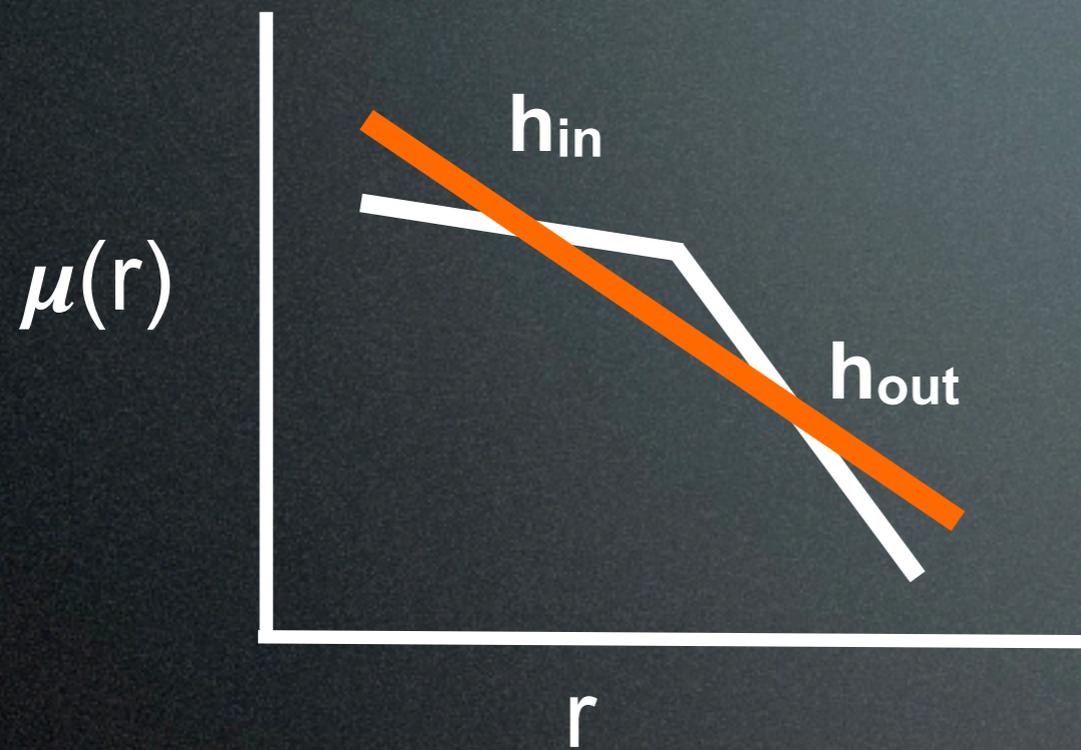

Bulge/Total is underestimated by $\sim 10\%$

Bar/Total is underestimated by $\sim 20\%$

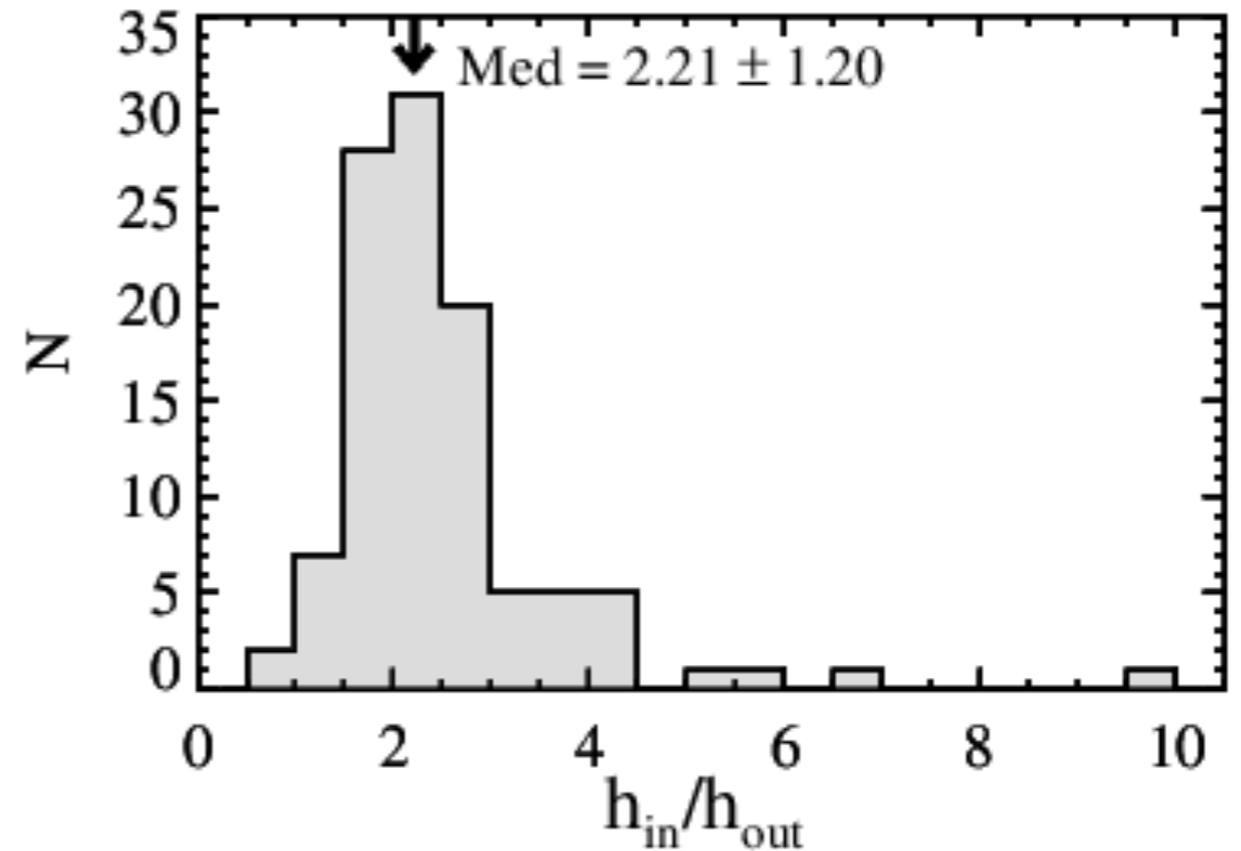

Not including disk breaks strongly impacts model fits!

ex) Disk size evolution?

Importance of including disk breaks

Type II (down-bending) Disks

Light profile of bars

$$I(r) = I_{\text{eff}} \exp \left\{ -b_n \left[\left(\frac{r}{r_{\text{eff}}} \right)^{1/n} - 1 \right] \right\}$$

Sersic Profile (1963)

Light profile of bars

Bar profiles are related to the **presence/prominence** of a bulge.

- Galaxies with a bulge have flat bars
- Bulgeless galaxies have both flat and exponential bars.

Interpretation

- **Bar profile : an dynamical age indicator of the bar?**
 - **More evolved bars should be flatter**
 - longer time to trap stars into bar orbits
 - **Consistent with the COSMOS study** (Sheth et al. 2008)
 - more massive, redder, and bulge dominated disks formed their bars first (downsizing)
 - **Need to better understand conditions that turn a exponential profile into a flat profile**
 - What properties of the bar, disk, and galaxy make this process most efficient? (Gas? Triaxial halo? e.g., Athanassoula et al. 2013)

Outer shape of bars

Generalized ellipses (Athanasoula et al. 1990)

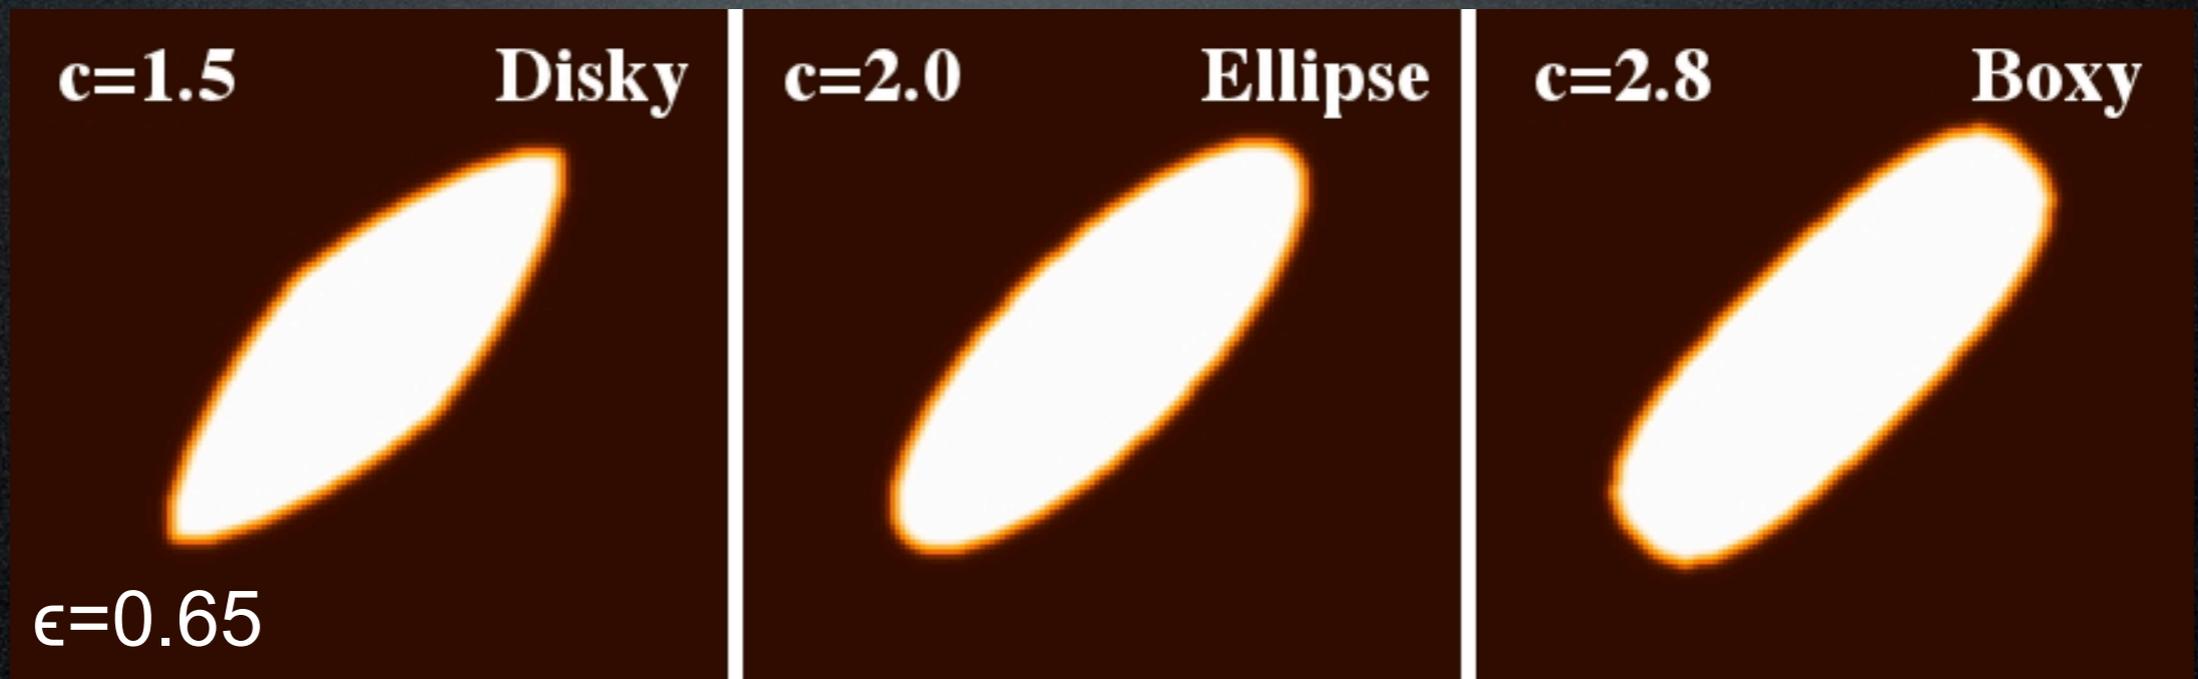

$$\left(\frac{|x|}{a}\right)^c + \left(\frac{|y|}{b}\right)^c = 1.$$

c: shape parameter

c < 2 : Disky

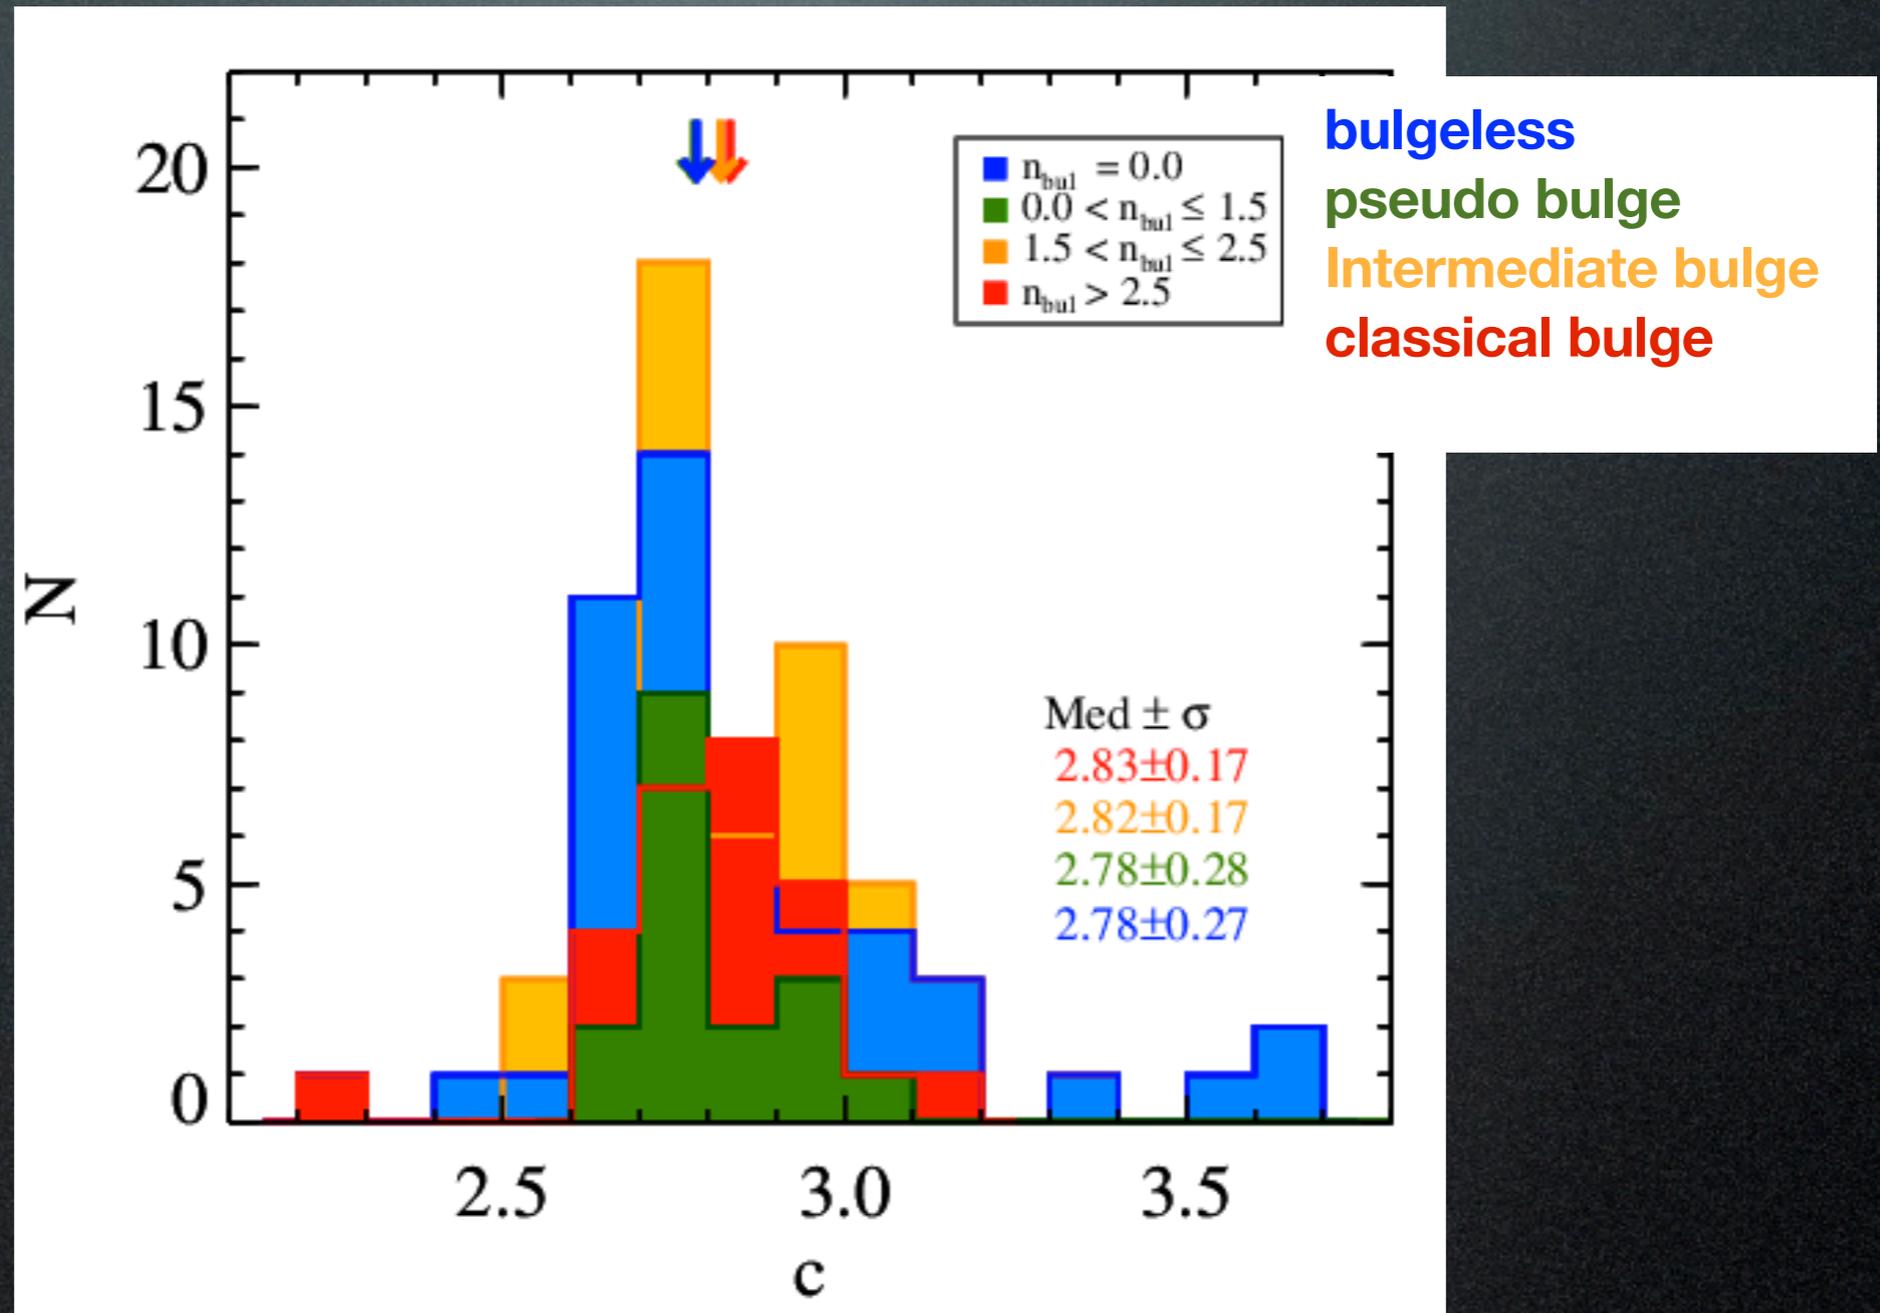

c = 2 : Ellipse

c > 2 : Boxy

Different shapes of bar models

Bars are boxy!

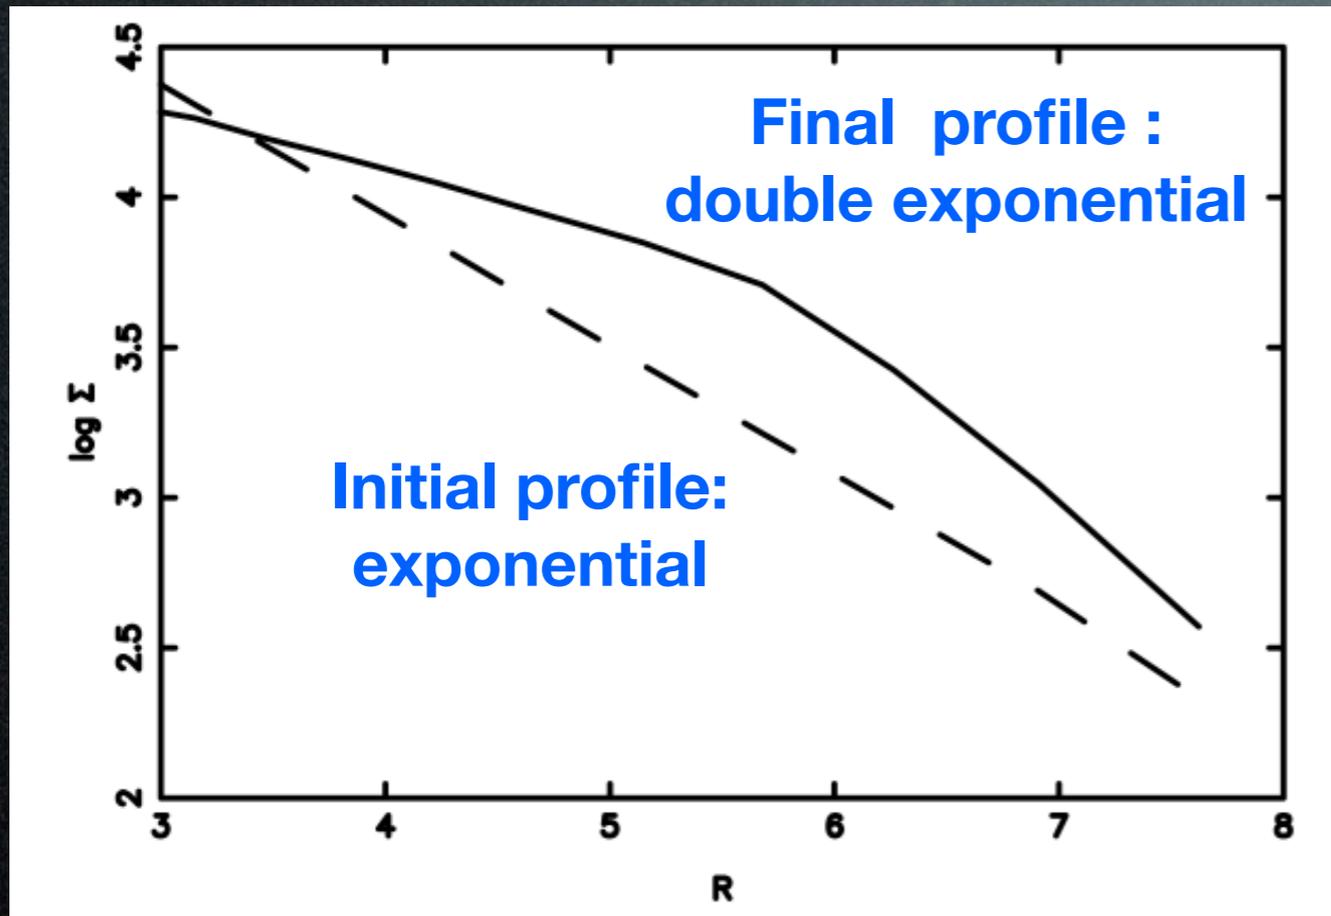

c : shape parameter

Kim et al. (2014, in prep)

No significant differences in the shape of bars

Bars changes in profile while keeping their outer shapes boxy

Role of Bars - Induce disk break

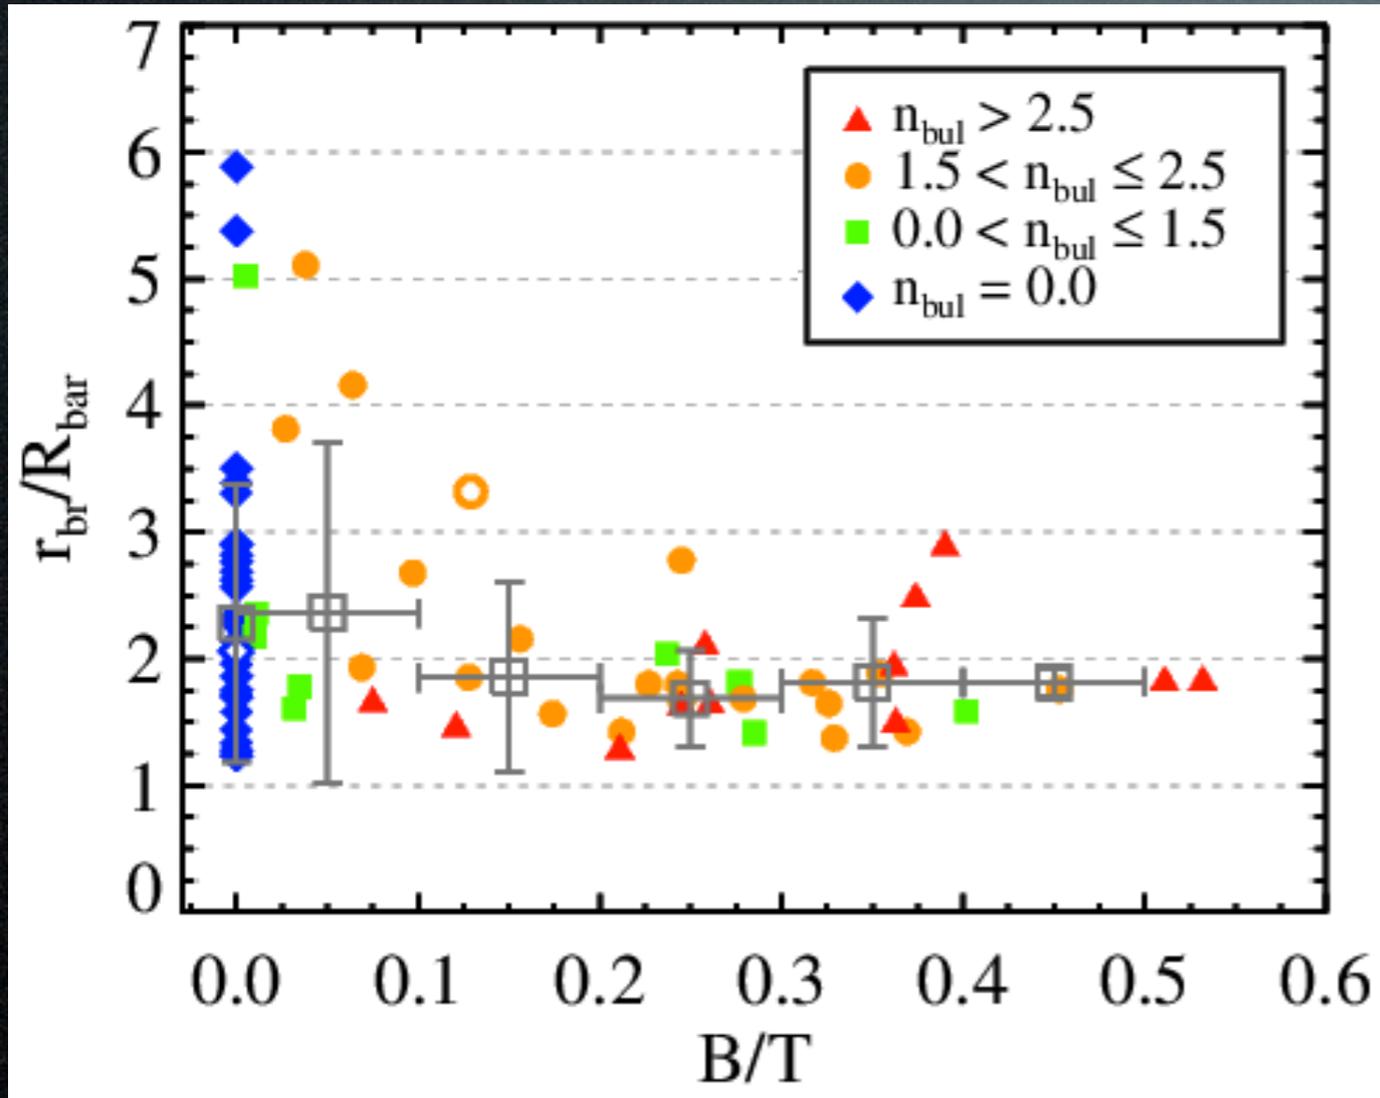

(Debattista et al. 2006)

Bars induce angular momentum redistribution

=> results in **disk break**

How are breaks related to bars?
Where do breaks happen?

Disk break

Galaxies with $B/T > 0.1$:

$r_{br}/R_{bar} \sim 2$, related to bar OLR

(Schwarz 1981; Buta & Crocker 1991; Buta 1995)

Galaxies with $B/T < 0.1$:

- resonances may be coupled with spirals (Muñoz-Mateos+2013)

- r_{br} may be star formation threshold related.

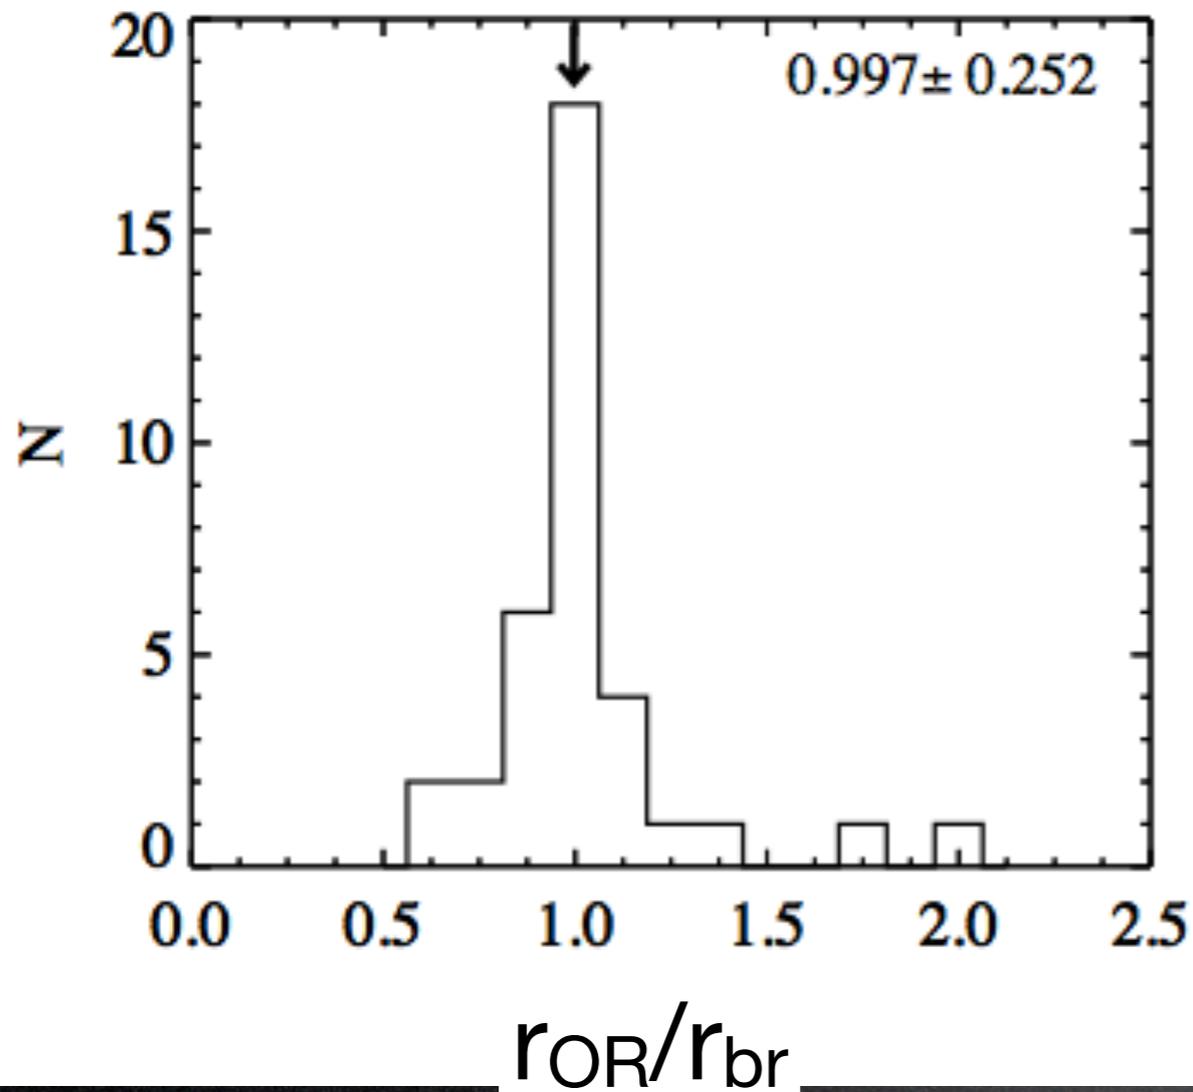

(Kennicutt et al. 1989, Elmegreen et al. 2006)

r_{br} : break radius

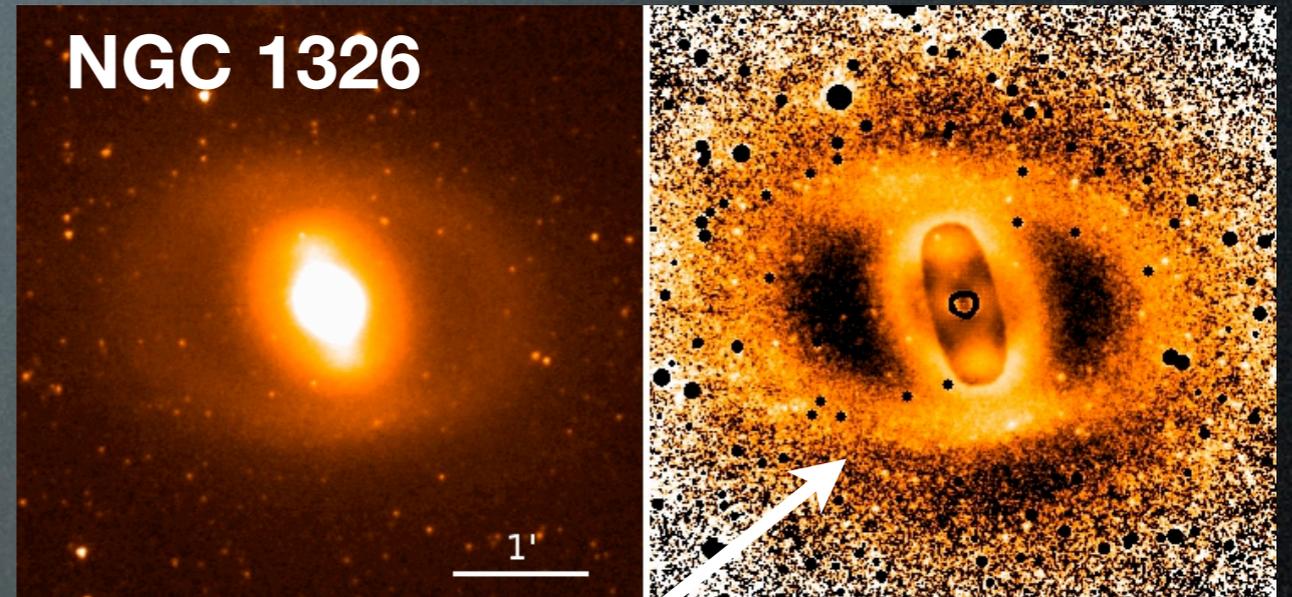

R_{bar} : deprojected bar radius

Where do breaks arise?

Type II Disks with an outer ring

Kim et al. (2013, ApJ submitted)

r_{OR} : outer ring radii from
Comerón et al. (2013, A&A submitted)
 r_{br} : break radii

86% of outer rings are in between
 $0.8 \times r_{br}$ and $1.2 \times r_{br}$

Disk breaks are at outer rings (\sim OLR of bars)

Let's break disks!

Summary

- * **Radial profile of bars** are related to the **presence of the bulge**
- consistent with the downsizing of bar formation.
- * Bar profiles change with **bulge properties** while **keeping their outermost shape boxy**.
- * **Disk breaks** should be taken into account properly in the model fit.
- * Breaks are related to the **OLR of the bar** for prominent bulge galaxies, and most disk breaks arise at the outer ring.
- bar plays a role in setting **the position of break**.

Thank you!
